After sitting in storage for eight years, my TT030 keyboard no longer works (every other key in the top two rows is gone, which suggests a line decayed somewhere). Anyone have an old one laying about that they'd care to sell?
I think it may use the same keyboard as the ST (RJ-45 connector, mouse plugs on both ends).

Thanks,
Greg

I Actually own Steinberg cubeat, but would upgrade to cubase (if I couldnt find Cubase audio 16 for falcon).

Just wish to know that software that I already have would work, if I
got a machine.

Thanks.. RJ

Steinberg UK still sell CAF for �199. Atari vendors may be cheaper though.

Mark

I have several big announceements from www.atarimagazines.com

The site now offers the full text of every issue of STart magazine. Published from 1986 to 1991, STart magazine was dedicated primarily to Atari ST computers, with some emphasis on Atari 8-bit computers in later issues.

In addition, the site now includes full-text articles from Creative Computing magazine. The archive currently offers the full text of 35 issues, spanning Creative Computing's final three years -- more than 1,100 articles. Published from 1974 until 1984, Creative Computing was a wonderful magazine for computer hobbyists that covered every platform. The archive includes articles written by Clive Sinclair, Adam Osborne, Bill Gates, and other notable names. We're looking for volunteers to help scan more articles from Creative Computing.

Finally, we have changed the name of the site from Digital Antic Project to Classic Computer Magazine Archive. Originally the site had only the full text of Antic magazine -- with the addition of STart and Creative Computing, "Digital Antic" was an increasingly inaccurate name.

Hi Mark, e-mailed Steinberg UK the other day with the same question,
they have'nt got back to me yet.
I did ask them did they still stock atari versions of cubase, to
which they replied they no longer stock, or support the atari version.

Nice to know your outlay gets the full attention hey?

RJ

Hi all.

Have a problem getting my CD drive (2 speed Hitachi 6550 I think) to work.

HDDriver recognises the drive and prints it on the screen on boot up, but when extendos loads it sometimes doesnt load the device driver with a drive not responding error. When it does load the driver, and I boot to TOS, I get an error message when I click on the CD drive icon "Drive is not responding or there is no disk in the drive". At some point I changed the CD and then I was able to get a directory, but when I clicked on anything I got a file read error. Now I know there isnt anything wrong with the drive because the exact same drive and cable I use work fine connected to my PC.

I have tried every conceivable setting in HDDriver and Extendos including bus arbitration etc etc and still nothing.

Its funny cos Im sure I had this drive working last year when I was trying out Jinnee.

Anyone have any suggestions?

Tia

hi all,

Recently, i got a TT which work very fine, but i would to solve this
strange display problem on my VGA screen, where the TT image is
shifted on the left side...Does exist some patch, software or event
hardware modify to apply ?

Laurent

The TT puts out a slightly off VGA signal, different sweep or something. I don't remember the proper terminology, but the Atari brand VGA has a swicth on the back of it to match the TT output. Far as I know there are no software solutions for this. I simply used a multisync display which had alot of adjustment to compensate for the odd signal. I don't know about any hardware fixes, unless you get a gfx card.

Hi Lonny and Laurent!

Many new 'digital' monitors (actually with digital setup controls)
allow you to move and enlarge the scanned area at will. I have
managed to fill a 15" SVGA screen fully from my Falcon after some
adjustment, and see no reason why the same couldn't be done with a
TT. I don't know whether any VGA monitors have digital controls -
they are probably too old for that. But even so most monitors have
internal adjustment for picture size and centering. If you only
use the monitor with the TT, then it should be possible to adjust

the position - just take great care as there are lethal high
voltages flying around the innards of the monitor. If yours
involves adjusting a core, make sure you use a plastic
'screwdriver', not a metal one!

BTW, the Falcon also fills an old IBM PS/2 mono monitor screen
fully, but the slight timing differences on the TT video output
may be the cause of your problems.

Regards, /Peter/

Hi All

I purchased a atari falcon last year and now I am getting around to
setting it up. It originally had a 220 ps. I switched it out to a 110.
are their any jumpers to change?

2nd ? is regarding the keyboard. the keyboard came unplugged internally
and doesnt appear to be keyed. I dont want to fry it . what is the
proper way to connect?

Falcon System board
 J18 (10 pins)
 pin 1 Pin   (closest to front of case)
 Pin 2 (No Pin)
 Pin 3-10 Pin(Toward back of case)

Keyboard
has 8 plugs
plug 1 yellow wire
plug 2 black wire
plug 3 No Wire
plug 4-8 black wire

3rd ? anything special for the internal ide drive I need to know?
I know I need the bracket and cable(I assume a amiga 1200/600 44pin internal ide cable will work but ?)

4) any realy good sites on falcon or atari stuff in general. I have found some realy good st sites, but not alot on falcon(other than specs)

Thank you for your time (hopefully soon to be a Falcon user)
mark

I remember eon's ago getting something similar to a wordprocessor on an st format coverdisk, the difference being, what I typed, the st would read back to me.

Does anyone know what this was called, or if a similar program exists,

```
and where I might find it.

Thanks.. RJ

Hi All,thanks for the info, found something that will do the job
here...
http://fp.modula.f9.co.uk/1/Disk%20Images/My%20Disks/On-line/website/menu.html

Great site of a load of atari stuff.

Hello everyone,

It seems I have gone and become a hypocrite myself, and in my mission to further make a fool of myself I have screwed up. This is a personal apology to all those involved with ACS Pro, including the author, Martin Elsaesser, for my comments regarding ACS Pro. It seems as though an email that I thought I had sent to him was never even sent from my end! An article of retraction is also posted on http://atari-source.com , and is available by following this mammoth link:

http://pikachu.atari-source.com/modules.php?op=modload&name=Sections&file=index&req=viewarticle&artid=19&page=1

Again, this is a personal and public apology to Martin Elsaesser of ACS Pro fame and possibly many more people as the article is discussed and read more. The article in question is 'A Sour Taste' published a few days ago under the "Personal Notes" section of Atari-source.com.

Hi, apologies if this is dead obvious.Only recently got a falcon and trying to figure out my way round the atari os again after 11 years away.

What it is, is that in future, I'll be getting zero-X, which is an audio program that can handle wav files. Very useful to ba able to transfer between my PC and falcon, on the same disk (and my sampler too for that matter).

Also, all the software I'm currently getting, off the net, it's a bit of a ball ache transferring it onto floppy disk to go and put it on the falcon.
Is there a way I can make both the Falcon and the PC read the same iomega zip disk so that I can bump everything onto it and transfer it over like that.

(For info purposes, I have HD Driver 8 which I'm using to format the zip disks on currently)

Thanks if anyone can offer up some pointers... RJ

I believe that HDriver has that option. Have you checked the manual?

Hi Rob!

Yes you should be able to do that. There should be no need to format the Iomega - just partition it with HDDRIVER and make sure that in 'Compatibility' the 'Windows' radio button is switched on and the 'TOS & Windows combined' checkbox is crossed. Note that this will only work with a single partition, but that shouldn't be a problem in your case.

As you may have seen earlier in c.s.a.st, I use a similar arrangement with SyQuest EZ135, using an Adaptec USB<->SCSI adapter. Originally I was going to move the drive from one machine to the other, but I managed to get a second drive cheap and now have one connected to either computer, so only need to move the carts. I see no reason why an Iomega should be different.

Regards, /Peter/

Small supplier/repair outfit closing and forced to sell stock.

Various 520/1040ST computers - working & non-working units, Memory upgrade kits (new) and memory chips, mice, monitor adaptor cables, switch boxes, spares and various bits and pieces etc. Hi-Res Monitors. Midi cables (new)

Ideal for person involved in training college or studio/s for CUBASE, Notator sequencing systems to enhance their repair/upgrade/service kit, service manuals also included.

Lot for sale, do not wish to seperate. Buyer collects. Email for list of items for disposal to nor999@aol.com.

Many thanks - Rick.

The following training manuals/video are for sale and all in new
condition:

'The Complete CUBASE Handbook' by Udo Weyers & GC Carstensen, pp423.
Reprinted 1995. Designed for Atari ST, Apple Mac & MS-DOS platforms.
(when new �29.95)

'The Fast Guide to CUBASE' by Simon Millard, pp132
Reprinted 1988. Designed for all thre platforms. (when new �10.95)

'Steinburg CUBASE' Video Training Manual, Presented by Chris West.
100mins Produced 1995. VIDEO in PAL VHS format.(when new �29.99)

==

'Atari Computing' Magazines for Sale
Issues 1 to 13, ie Sept '96 - April '99
All copies in very good condition. (when new �3.00 - �3.50 each)

All the above are available in Croydon, Surrey, UK.
If you are interested please email nor999@aol.com
Many thanks
Rick

Hi,
does anybody know the author of the software part of the Janus Emulator (the old distributor couldn't help me) ?

Thanks Bernd

My Falcon's audio inputs aren't working.
At first I thought it was the mini phono plug itself, so I opened the bird and began to probe around with my circut tester. Just off the phono plug are two round bushing looking things with wire coiled around them...from that point on the board (L35 & L33?) are orange looking butter bean components of some type marked B 102k which are then soldered onto the negative end of C56 in a Y like fashion.

Is this something original to the Falcon or has it been added (no telling who all has owned this CT2 Falcon before me)? Also, what are these 'butter bean' things exactly? I assume they are resisters of some sort...but what type exactly? I notice when I test identical looking components elsewhere in the Falcon with the circut tester set to the ohms setting (with falcon powered OFF), they give a 'consistent' reading between 100 and 102...but these two cause the reading to constantly jump erratically. Does this mean they are BAD? Should I replace them? If so...what on earth are they and how would I go about ordering them? I suspect this is the problem, as I accidentally discovered when probing around the phono jack with jumper wire that bypassing these butterbean things allows an audio input signal. For just a second with a very low audio level...I touched jumpers to bypass these two butter beans, and had crystal clear audio. I don't wanna blow anything...so just wondering what to do to get it working 'safely' again.

Here at the house I have a batch of 100ohm 1/4 watt %5 tolerence resisters (brown black brown gold). Would these work safely in place of the 102k orange butter beans?

Finally...I'd really like to have the Cubase patches done...maybe they've already been done...but how do I tell? I grabbed the schematics for the audio part of the falcon, but don't see most of the circuts listed at all...are they on the underside of the motherboard?

Thanks,
Brian

The "orange butter beans" as you call them sound like capacitors, the 102k
value sounds like a 1 nanoFarad capacitor. The resistor is a 100 ohm value
(brown black brown), the gold band is tolerance (5%).

Just to be trebly (3 times) sure I tried the cable from my PC in the TT. As expected (but not as hoped) it makes no difference.

It's pretty easy just a few 40xx cmos and a TL494, don't know if there is
any pcb layout floating around tho.
I have the manual here somewhere and the schematics were in it, I can scan
it and send it to you if you want.

Thanks for your replies. I have changed the games to joystick control
but there is still no change - and the joystick is plugged into the
Mouse\Joystick port.
If the ports had broken, why would the Y\X axis on the mouse work?

The scsi cable has to be extremely short in the MEGA STE and TT for its
internal HD, something like 6-8 inches max.

     Hi, Andy!

AC> I have changed the games to joystick control but there is still no
AC> change - and the joystick is plugged into the Mouse\Joystick port.

Hmm - so you'll have to check the ports...

Hold your joystick constantly into one direction and move the plug (in the
mouse/joystick port) carefully around. Do you find a "working position"
for at least one direction?

AC> If the ports had broken, why would the Y\X axis on the mouse work?

Maybe its not a soldering problem, but a contact problem plug-port?

Otherwise: re-soldering of the ports is not such a hard job to do...

     Greetings,
```

Alexander

Hi

Yup, there were a couple produced. The one I have is called 'Unison programmer' and plugs into the cartridge port.

THe original cable cable is of the order of 9". The new cable is longer but
the originqal 100 Meg IBM works with it. I don't beleive its a cable probem
at all. I think the drice does something the TT does not like....

That's unlikely because the TT has a standard SCSI bus. Up to know any
drive has worked with it, be it old or new. Note that it might also be
possible that there is simply something wrong with your TT's hardware.

I have a Falcon Computer with a Maxtor 80gb internal hard drive
and a cendyne internal cd-rw drive.
Both are connected to the Wizztronics IDE Hard DRive adaptor.

The Maxtor is the master and CD-RW is the slave.

Would the CD-RW Drive work/operate better if it was set as the master
and the Maxtor as the Slave Drive.

The Maxtor drive is also my boot drive.

Both Drive's manuals state that each should be master.

Thank You
Mike

I don't think you'd be able to boot from the Hard drive if it
was Slave.

>Both Drive's manuals state that each should be master.

Maybe it means in a PC.  On PC you should use one IDE chain for
hard drive, andthe other for CD ROM.  This makes copying between
two much quicker.

How do you mean "work better". Are you producing "coasters", or do you have
to burn at reduced speed?

> >The Maxtor drive is also my boot drive.
>
> I don't think you'd be able to boot from the Hard drive if it

They always do, but if that is the case why do they bother to put slave
jumpers on them? If you only have a single IDE interface then I think as
Lyndon says you don't have any choice. The hardrive must be the "Master" to
boot and the CD-RW there fore has to be the slave. I also seem to recall

being told many years ago that for IDE you should always place the faster, higer performance drive as the master as other wise the system could be slowed. I assume in this case that the hard drive is the quicker and so should be master. However modern IDE drives do not seem to have this problem.

> Maybe it means in a PC. On PC you should use one IDE chain for

I have not noticed this. I would have thought that in general for most CD/HD combinations the speed of the CD drive is much slower than the hard drive and dominates perormance.... (but I am prepared to be convinced by benchmarks..)

Sorry for the ramblings. I have now had a further play....

- Some one metioned they had problems with their PSU so I checked the
voltages and they seem o.k.

- I have tried two small (about 100 meg) drives and they both work fine and
they use more power than the 2Gig units (could be the 2 gigs are more
sensitive)

-I wondered if the internal termination ws duff so I removed it and tried an
external terminator, with no noticable change.

- I fipped into vandal mode and I popped a cable with two connectors, (so
its too long) onto the TT MBO , and plugged in one of the 100 Meg drives and
a SCSI CD drive (which some one gave me from their junk box) in via a disk
drive power splitter (so the PSU is well loaded) and both seem to work fine.
(using METADOS and AHDI and its the first time I even tried METADOS)...

So I still think its the drive being odd, but on the other hand none of the
above are "performance" devices so it could still be the TT.

Still having fun, especially with META DOS. I never thought that would
work.... And thanks for all the suggestions to date..

```
Dave.

It's so that when you copy from CD to HD, the IDE controller
doesn't have to read from CD, stop, then write that data to HD.
```

I believe with two IDE chains it simply streams across, less CPU
overhead?

Hello

I laid my hands on a SCSI ZIP100 drive.
The drive can be told to terminate by a jumper.

Now I want to remove the termination on my TT's motherboard, because with this termination, no SCSI devices are seen at all.

I see 3 red strips in the rightt rear orner close to the SCSI socket.

The TT is one with the brown paint in stead of metal shield.

Are these 3 strips the terminator?
Do I have to mark how they were placed?

There never has been any room for electronics in my brains ;-)

Hi Henk,

Yes thos 3 "strips" are the terminating resistors. you can remove them with tweezers or needle nose pliers carefully to have both an internal and external drive, since they're not polarized and are essentially 3 of the same component you dont have to put them back in (if you wanted to) the same way as they came out.

I dont believe that is true. Each drive has its own controller but the Master is the one that tells the Slave to wait or to go ahead. It would be the same with the secondary Master, it would tell the Secondary Slave to wait or go ahead. And if I remember correctly the the CPU usage would be very high. If it was SCSI it would be a wham bam done.

This is possible, but only with SCSI peripherals. The SCSI standard
defines ways for two devices to transfer data directly, without using
the computer's main memory. IDE/ATAPI devices cannot do that.

No. They all are the same. When you plug them in, just place them
with the point on them in front of the mark on the MoBo.
Should you plug them reversed, you could experience strange things
happening ;-)

I once used an active terminator, but then this caused HD-D (8.03, I
didn't try with 8.11) to hang. I fixed this plugging a terminated
external device to the TT.

>- I fipped into vandal mode and I popped a cable with two connectors, (so

>(using METADOS and AHDI and its the first time I even tried METADOS)...

>So I still think its the drive being odd, but on the other hand none of the
>above are "performance" devices so it could still be the TT.
If "Check peripherals" or "ID Check" (depending on the software you
use) does detect the drive, then it is a problem with jumpers.
For instance, some IBM drives need the SPIN UP jumper to be set when
driven with HD-D (8.03 - didn't try with 8.11), though HUSHI doesn't
need it. And so with Disable TI Sync.
Just go to the manufacturer's site and grab information about the
model you try to use.

>Still having fun, especially with META DOS. I never thought that would
>work.... And thanks for all the suggestions to date..

Definitely - that's why I was never able to put the schematics in the
archive with my software (which is not (C) Maxon, of course).

Just a quick note to answer a lot of questions. IDE is a fifo type controller, that means each device takes a turn on the bus during use. If you copy from the hard drive to the burner it can become congested and fail a burn. CDr's need a continuous stream of data to work reliably. In the PC world the crappiest drive on a single bus(i.e. master or slave), will hold it back to roughly that level of performance. Hence don't stick a ata133 hard drive on the same bus as a pio mode 3 cdr and expect lightning speeds out of your new drive. It makes absolutely no difference which drive is master or slave, but I would suggest that leaving the hard drive as master would be a good idea, as it should be faster to boot. When I build pc's at work, I always put the cdroms on the secondary bus to let the hard drive run full pelt.

Mark Bedingfield

Do you know the URL for this Maxon? I tried searching for maxon
but there seems to a lot of other comapnies with the same name.

I think the relevant jumpers on the drive are

"Disable Auto Spin" which stops it working all together,
"SCSI Term ON" which again stops it working if not set properly,
"Disable Unit Attn" which makes no difference
"Disable Parity" which seems to make no difference

There are some to set the "Auto Start Delay" but I think those are where you
want to power up an array of drives in sequence. And in answer to BillF the
drive works fine in my PC on an old Adaptec clone card.

On the TT HDX will detect format and partition the drive, and on a re-boot
it can read the partition table. The demo version of HD Driver also finds
this partition table. Are any other (free) disk drivers worth trying?

Hi there,

i am using an Atari Mega ST 2 for my MIDI stuff. I also own some old games and wanted to play some on weekend. So, i connected the Mega ST with a colour screen cable to my TV-Set, normaly it should work fine. But, it is very difficult to see anything. I opened the eyes and i can hardly see the desktop on the TV screen. It is a very dark screen i get. And, i cannot recognize any colours. I tried two different cables and TV-sets, but the problem remains. I am using TOs 2.06. Does anybody know this problem? Is this a severe hardware problem? In 640*400 Mode on a Atari SM 124, it works without any problem.

Thanks for your help!

Thanks for the replies.

I sense a slight difference in opinion about how to put them back.
So I'll take no risk.

My TT was the last of my computers without a zip drive.
This gives the verb 'zip' a whole new meaning.
I dont need to zip anymore, in stead I just zip.

I can move data around my computers without the need to have them all switched on
at the same time. A condition very beneficial to my ears, the temperature in
the room, the state of my nerves and the mess on the floor.

Also, my computers, who all speak different languages, dont have to talk to each other.

The two meanings of the word zip in this respect remind me of a obscure
philosopher
whose name I cant remember who stated that the universe is not expanding but that
everything in it is shrinking.

>I sense a slight difference in opinion about how to put them back.
>So I'll take no risk.

The resistors are 9 pins SIL components, PIN 1 beeing common and
connected to 0v, and 2 through 9 to the signals. It's the same as
8 resistors with one side each connected to 0v and the other to
a signal. It only takes less space.
Plugging the SILs reversed will not be hazardous for the hardware.
I got my Falcon with all three terminators plugged reversed, and
it only became a problem when I connected a streamer : this caused
the system to hang many times, before I discovered the reason.
Then, I discovered that most of the data on my hard disk was corrupted
as well :-(fortunately, I could retrieve most of them
from older backups I made with my MegaST before I bought my Falcon.
Pin 1 is marked on the TT's MoBo as well as on the resistors.
So, don't worry, go on!

>My TT was the last of my computers without a zip drive.

On the Falcon it's more than just resistors, might be same for
TT.  On Falcon it's a resistor and capacitor.  Can't remember
how they're conencted, in series or might be one going to Vcc
and one to ground.

Folks,

Just to follow up on this I went to the local computer fair today an bought a selection of small SCSI hard drives, 2 x 1Gig and 2 x 2Gig. Total cost �18.00 plus entrance. I tried a 1 Gig first and that seems to work fine. I have not run extensive tests but I can open drive windows and copy files to it, no trouble.

Thanks again for the help

Dave.

P.S. I also bought a couple of SCSI cables, total cost �12.00, stupid or
what ....

I guess that the magazine is still copyrighted.  I have just
sent an email so I'll have to wait and see.  One interestting
point is that Maxon in the UK have the same address as Hisoft
used (still?) have.

Isn't there a CD rom with all the C't and ST computer stuff, or
is it only a few of the articles that were done?

Thanks.

C't was selling CD rom with all articles by year starting from 1990.

Take a look at http://www.heise.de/ct/ (I don't understand german)

I know the question comes up from time to time about where to buy Double Sided, Double Density floppy disks, since they've become pretty rare in the marketplace.

I spotted this page while browsing around for other things- they have DSDD 3.5inch floppies at $20.00 for a package of 500 disks.

Yeah, who needs that many, but at only 8 cents each don't complain..!

(Shipping is $18.50 (ouch) for 500, but it's still cheaper than I've ever paid for floppies.)

And- they say they ship in the US only. Sorry about that..!

These are on "clearance" so who knows how long they'll have them.

http://store.yahoo.com/cdrdvdrmedia/500pcsflopdi.html

Hi James

These SIL resistor packs most certainly ARE polarised.

With the lettering towards you the hot pin is on your left and usually marked with a dot.

> Yes thos 3 "strips" are the terminating resistors. you can remove them with

Well, the 3 red thingies I pulled out have nothing written on them.
All 3 have 8 pins.

Besides, without them and without anything connected to the SCSI plug
my TT just starts up without a problem.
But I suppose I better put them back.

I think this whole termination annoyment is a serious design flaw in the SCSI.
;-)

The zip doesnt work :-(
It is recognized by the ide scan.
It doesnt pop up in the partition dialogue.
(I want to put a DOS/TOS compatible partition on the media)

:-) Not at all. It is well defined which devices has to be terminated
and which device must not be terminated. This has worked fine since SCSI
was introduced ages ago.

> (I want to put a DOS/TOS compatible partition on the media)

You tried to partition the media according to the HDDRIVER manual?
Please send me the serial number of your HDDRIVER, as you are not yet a
registered user. Thank you.

```

Lyndon,

Having toasted an AT PSU in the past I will stick with my advice. I guess
modern PSUs have to cope with a wider range of loads and may be more
tolerent of being unloaded. Better safe than sorry. I was going to say a
disk drive should be enough, but I was not sure about modern drives....

Dave.

Hello !

I have 1 Atari 1040 STF and 1 Atari Megafile without cable.

What is the schematic of this cable ?

Thank's for your help.

;-)

Hi there!

I want to move a couple of gigs worth of files (mostly midifiles and very
large music samples) from the ATARI to the PC. Have scsi on PC but ATARI
hard drives not recognised. Any suitable suggestions welcome.
Thanks
n!

look at hardwarebook.net. AFAIK it's 1 to 1.

Indeed it is 1 to 1, but one should NOT use just any cable with appropriate number of leads, because data transmission errors may occur out of impedance mismatch (I once bought for that purpose a nice-looking shielded cable, but...). Original megafile cable was shielded, but I have heard some people report problems with it because that cable was shielded at both ends (loop problems). Now I use daily a hard disk connected throufh ACSI ports with a short length (30cm) of flat cable (like the one used for connecting floppy or hard disk drives) without any problems.

Btw. in some parts of the world it may be a problem to find 19-pin D-connectors for ACSI ports.

This afternoon I did a bit of skip-diving at work and managed to come up
with a rather nice external SCSI case/Power supply. Even better, on opening
it up I discovered it contains a Micropolis 3391NS Hard drive.

A bit of Googling says this is a 9Gb, 7200RPM SCSI-3 drive. I don't know if
this drive works yet, but it spins up when power is applied.

Now, is there any chance of hooking this thing up to my ST? I don't suppose
my Supra host adaptor will support it?

Cheers,
MikeW

I dunno if the Supra adaptor will support it or not, I've never had a supra
drive. but you'll need HDdriver probably to make use of all the space, Theres
a program called "bigdos" which allows STs & TT's to use partitions up to
1gigabyte (if you need any that big) with HDdriver. One other thing, check the
connector on the drive to see if its 50pin or 68pin (its probably 68) that will
affect what cabling you need.

Basically you can connect any SCSI drive to the Atari. Whether SCSI-2 or
SCSI-3 does not matter. Some old host adapters, however, do not
generate parity information, which is often required by the drive. Some
drives have jumpers to switch off the parity checking.
Also note that if the Supra adapter is not ICD-compatible you cannot access
more than 1 GByte of your hard disk's capacity. For getting the full
capacity an ICD-compatible adapter and an appropriate hard disk driver
is required.

There is a program called PARCP which links the PC and the ST together using the parallel printer ports. YOu would also need a special cable that you can either build or buy from the author of the program. I have used it to transfer files to and from from wife's PC and my Hades. Works great. Try the site below to get more information and download the program:

Hmm, must have been a good skip to find something like that!

You could always try it. Uoi might be able to use first 1GB
only though. Really for 9GB you'd be better using HDDriver.

The main difference between the LINK96/97 (which is not an ICD product but from WB Systemtechnik in Germany) is initiator identification, which is only provided by the LINK96/97. This feature provides the Atari with a SCSI ID of its own, which is required in order to use certain SCSI peripherals. In other words: The LINK96/97 adhere closer to the SCSI specification than other host adapters.

Thanks for the info.  I'm working on setting up a network (I'm currently
collecting the equipment), and wanted to understand why the Link 97 was
needed for the Daynaport SCSI ethernet adaptors that I am going to use.

Got the psu sorted out but the dam thing wont work on the back are 2 switched one is marked (A O B) the other one is marked (I O X), and i have tried all combos with no luck, i can get the disk to spin but not read , write or format?

Is the drive dead?

If you are cluey, tryswapping the internal and external drives on the ST and see what happens. You won't be able to fit the drive in the case, so just try it flying by the internal lead.

Mark

Folks,

I have recently aquired a TT with a duff hard drive. I tried an old IBM WDS3100 and that works perfectly but I want more than 100 meg. When I try anything more modern (I have tried a IBM DRS32160 and a Seagate ST32155N) both of which are nominally 2 GB they do not seem to work. AHDI finds the drives and HDX will format and partition them, the desktop finds the dirves and installs letters, but when I try and open a drive window the system just hangs. The demo of HDDRIVER also finds the partitions but also won't open a drive window. It just appears to ignore my clicks. I have tried with termination on and off, also with a wide slection of parameters set on the drive, includinging Disable Parity, Disable Unit Attn (Ibm Only). I have not messed with "Term Pwr" could this be the problem?

Any other clues or suggestions.

Dave.

I have a couple of these drive units (PC 720B) and somewhere I
have a little instruction booklet that came with them but it will
take me a while to sort out where it is. Meanwhile someone else
may come up with the answer if this refreshes their memory.

The units I have were used with one of the switches to enable
copies to be made using the BLITZ method (disk also supplied).The
other switch is used to control booting from A or B drives.

Which is what Im afraid has slipped my old senile brain but I will
get the grandkids to sort through my boxes to find the booklet.

Sorry not more helpful,maybe a magazine collector can help as when
I boght the units there had been an article about them in one of
the mags.

What size are you partitioning it to? I think you should try 4
or 5 partitions at about 450 MB each. TOS has a limit on the
partition size, not sure what it is with TOS 3.0x. If you want

```
a large partition you'll need FAT32 partition and an OS to
support it, Magic 6.2 and Mint do.

With TOS 3.0x the maximum partition size for TOS compatible partitions
(without MagiC or MiNT) is 512 MB. With MagiC or MiNT it is 1 GByte.

No, this cannot be the problem. As long as the drive is recognized everything is OK as far as settings on the drive are concerned. Note, however, that you have to ensure the termination is correct. Even if it does not seem to make a difference whether you terminate or not, always ensure that it's correct.
As already discussed it's quite likely that your partitions are too big for your version of TOS. And keep in mind that AHDI is not able to access more than the first GByte of a SCSI drive.

I don't think the partition size is giving me the problem. I have tried
various sizes, with no difference. I have checked the termination. The TT
internal terminators appear to be in place and the "Termination" link is set
on the drive.

When I try and open the drive with AHDI loaded the drive light flashes and
the system hangs. With the demo version of HDDRIVER nothing happens. HDRUTIL
does find the partition tabel and correctly reports the sizes. It also
creates the correct number of drive icons. With AHDI I get fewer, but of
course it can't see the end of the drive..
```

What fun What joy.....

Hi Dave,

When I got my TT, then soon after HDdriver, I had to use a utility called "bigdos" to use partitions larger than 512MB. I heard mint allows this as well but when I tried freemint it crashed neodesk and just about everything else I tried to run so I put it aside for now.

So how big are your partitions actually?

> When I try and open the drive with AHDI loaded the drive light flashes and

I guess you mean that the desktop displays the correct number of drive icons? (HDDRUTIL does not create any icons.) If the desktop recognizes the correct number of drives, but cannot access them, it is typcical for partitions that are too large. Please check your partition sizes carefully. The partitions must be smaller than 512 MB.

Hi guys,
I own an Atari ST 1040fm, and I'm interested in getting my hands on some more Atari gear, namely a 1040 STe, an Atari monitor and a SCSI adapter or an ASCI ext harddrive of some description.

Could someone point me in the right direction here? I've searched most of the day (in between working while the boss walks past and no luck.

Any help is greatly appreciated.
cheers

Sciby.

> Basically you can connect any SCSI drive to the Atari. Whether SCSI-2 or SCSI-3 does not matter. Some old host adapters, however, do not generate parity information, which is often required by the drive. Some drives have jumpers to switch off the parity checking.

Oh good. After a bit more skip diving I've come up with an external 2 bay SCSI case with PSU, an old Apple CDROM drive and the Metropolis 9Gb drive I found earler. I've hooked it all up to the Adaptec 2940U in my PC and everything works fine. Both devices have links to select parity so that's a good start. So, onto the software...

> Also note that if the Supra adapter is not ICD-compatible you cannot access more than 1 GByte of your hard disk's capacity. For getting the full capacity an ICD-compatible adapter and an appropriate hard disk driver is required.

Hmmm. I don't think the Supra host adaptor is ICD compatible. I remember getting a copy of the ICD software about 10 years ago and it wouldn't work :(

IIRC, the Supra software only allows 16Mb partitions - I had 6 on my 90Mb drive. While I don't mind only being able to access 1Gb of the drive, is there any free software around that'll let me use bigger partitions and possibly the CD ROM drive?

Many thanks,
Mike Wynne

Since STe computers haven't been made in a decade or so, I'd keep an eye on Ebay Australia. For the SCSI adapter, http://www.atari-workshop.co.uk/products/host_adaptors.htm is a good place to start.

> Atari TT-RAM card ?
>

Assuming you have a CA401058-xxx I think most any 4Meg 30 Pin SIM would work. Mine had 70ns 1 Megs in, and I replaced them with 4Meg 70ns which seem to work fine, but they have not had much testing. The speed is usually appended to part number so you will usually see "-70" for 70 ns chips, or "-60" for 60 ns. Just make sure you reset the board to "Non-Burst" if it has burst mode chips in at present, and reset the other links for 4Meg chips as per

http://pp.fishpool.fi/~q-funk/TT030/tt-ram.htm#CA401058

Well I got a Hard disk working with my Atari ST. Now I'd like to add a Cdrom. I have an external case with an ICD adsci +, and a 200 meg Scsi Harddrive. There are two Dma connectors on the back of the case. Do in need another adaptor ? The cable in the case has a free connector. Id like to get the Susy B and Compedium CD's working.

Thanks Bud,

Dave Wade wrote:

> I tried 400 meg partitions

In this case it's most likely that something is wrong with the cables or
the termination. 400 MB per partition definitely do work with TOS 2.0x
and newer. Do not forget to check the terminators on the TT's
motherboard, which must be installed if only one drive (internal or
external) is present. They must be removed if both an internal and an
external drive are connected.

I used a moderatetly old PC PSU (circa 1997) when my STFM PSU gave up,
but a friend fixed the original power board and all is well again in the
world! It was a large resistor thing that had gone open circuit, if
that helps.
Just be careful though, as some PC PSU units have 240v live exposed at
the switch...
As a tip, I used an old connector from a PC so that I could connect the
PSU when I wanted to (i.e. it wasn't permanently soldered to the
computer motherboard)
Also make sure that it is set to 240v and not 110v! I made that mistake
once... bang!

A scsi adaptor, like link & link 2, shouldn't cost that much to be
posted to you as they are relatively light.

Huh? Out here in the USA, we use 110v, not 220v (well, there are case where
we do use 220v (like our Spa), but not normal household wiring. Unless you
live in European countries and such, wouldn't you set it for 110v and not
220v, to insure your power supply doesn't... OOPS!

"Aw, poor little power supply fall down, go   B A   N   G ! ! !" :-)

Jared

I thought that but  my old 100 Meg IBM works fine on the same cables. And
the drive works fine
in a PC on an old(ish) 16-Bit SCSI card. Could it be to do with Sync
Negotiation or the like?

Hi "Jared Falvo"

Why oh why couldn't you have been in one of those towers on the 11th.
You asshole, this guy was participating in a serious thread, something you
never have.

That's very unlikely. But just try to switch it off, most drives have a jumper for that. Current versions of HDDRIVER, by the way, automatically tell the drive not to use synchroneous but only asynchroneous transfers. Also note that the fact that another drive works with your cables does not necessarily prove anything. Different drives can react diffenently if SCSI signales are not tranferred properly.

The fool has a point - I assumed people were in the UK. Well, 240v for
the UK and whatever else for your own country...
Though some PSUs do auto switch. And then again I assume some will only
be for one supply rating. Be sure before turning on!

Hi, the joystick on mt Atari ST 520 FM appears to have ceased working. Sometimes games will recognise the fire button, or VERY small movements, but apart from that there is no movement. I don't think the joystick itself is broken, as I have the same problem with a joypad - the mouse however, works perfectly. Any ideas? Thanks in advance

Hi, Andy!

AC> Sometimes games will recognise the fire button, or VERY small
AC> movements, but apart from that there is no movement.

Sounds like a mouse was expected by the game - you should switch to
joystick control within that game. (You are using the joystick in the
mouse port, right?)

Greetings,

Alexander

It's typical for the ST joystick ports to stop functioning - they could need
re-soldering.

Jon

Multiple. I know of an old c't EPROM burner that was attached to the c't universal I/O port, then the "EasyPrommer", its Successor "JuniorPrommer" and the clone called "Vesuv". All were published in german magazine articles.

The last three can be used with my "Pinatubo" driver software, which is now freeware. However, Software and magazine articles are only in German.

Note, however that the original Maxon software will only work correctly on
unmodified 8MHz STs - on faster machines, the programming timing is wrong.

That was one of the reasons why I started writing my own software.

I might have asked this before, but were the schematics
complicated, or just lots of TTL? Would I need to know German
to assemble one, or just follow the schematics? I don't have a
EPROMer but could be useful. Thanks, damn should have bought
the 32pin ZIF I saw real cheap :)

Hi

Iirc the link 2 prefers parity to be switched off.

Personally speaking i didnt think much of the software that came with he
link, and went for hd driver:)) as this has more features and is still
supported:)

Modern SCSI drives replace bad sectors by other sectors automatically, so usually bad sectors are never found, unless there are so many that the drive cannot replace them anymore. In this case the drive has to be formatted. Using the FAT for mapping errors is hardly required. You don't have a choice here anyway.

> SCSI hard disk? and stuff like that to get top performance. I have set-up
> one 32MB boot-drive and four 200MB BGM type drives Any advice is welcome.

The performance depends a lot on the hard disk driver. Do not use AHDI if you want top performance. Everything else, e. g. the partition size, is not really relevant.

No promises, but you might be able to take away an STM (with all the
bits and pieces - external power supply, external floppy drive, external
special modulator lead thingy) IF I can't sell it first. Will let you
know.
Postage could be more than the machine is worth though...

Glad you've got it up and running :-)

>Anyway, I would like to know what would be the best set-up ideally. Should
>the error map be best on SCSI or FAT? Should I enable parity checking on my

You shouldn't format SCSI disks unless you're suffering from bad sectors. Partitioning is enough. But your question - I think that SCSI is best, that would keep the bad sector map in the drive and not on the disk IYSWIM.

Normally parity should be set to "off". I'm not sure that the Link2 supports parity anyway.

>one 32MB boot-drive and four 200MB BGM type drives Any advice is welcome.

As I said, best keep to the AHDI-compatible mode. If you change to HDDriver in the future it'll be easier to install (there is a utility to change partitioning schemes but why risk it?).

Cheers

Derryck

I'm selling 2 versions of Dr.T's Copyist Professional DTP software. V1.6 (3 discs) has a problem with the backup disc; as a result, I ordered the upgrade v1.7 (3 discs), which has more features. This is a great software package with very few automatic features, which means you can put practically anything on your score that you want. I used this software for years on my Atari before going to a PC version. Some features include: importing and trascription from a sequencer, user definable fonts, user customizable macros, mouse and keyboard entering of symbols, and much more!
I am including the 6 original discs plus some backup copies I made on floppy, as well as both manuals and a cardboard wall poster outlining many of the commands for reference.

I no longer have an Atari computer, so (unfortunately) I have no way of testing these discs to see if they still work. This package is therefore being sold as is, with no guarantees (sorry!).

Best offer.

I have an old Atari STFM which I want to upgrade, but it has a dud floppy drive, so I want to replace it. I researched some upgrade documents on the net so I'm hoping I am not re-asking stuff.

The floppy is an old single sided belt driven 400K drive (chinon F353AT) with an adapter board labelled C025913 that sits between the drive and the floppy cable. IIRC it had an I8048 and may be responsible for translation of some signals. Is the adapter board necessary?

The floppy port supplies both DS0 & 1 Signals, does this exist in all models?, do I have to set the drives both to DS0? or can I use an adapted PC floppy ribbon cable to put both drives outside the ST case and use the space in future for a fan, hard disk, daughter board, or whatever.

If I am stuck with the internal floppy drive, does anyone have a recommendation for a 1.44 drive that will minimize modification to the ST case.

Thanks
AXELL

I don't believe modern CMOS drives need this board. Does the chinnon
have a 40 way connector, or is it one of the early one with a proprietry
interface? If the latter the board is not needed for a new drive.

> The floppy port supplies both DS0 & 1 Signals, does this exist in all
> models?,

If you mean the large connector on the back I think this may only have
one signal active. Early STs had no internal drive, the external had a
through
port, but swapped DS0 and DS1 so you could daisy chain drives.

>do I have to set the drives both to DS0? or can I use an

> adapted PC floppy ribbon cable to put both drives outside the ST case
> and use the space in future for a fan, hard disk, daughter board, or

As I said above early STs did this but not sure if modern ones actually
have both DS0 and DS1 on the external connector.... However With some
minor modifications it should be possible to have two external drives...

> If I am stuck with the internal floppy drive, does anyone have a

Jagfest 2002 Goes to New Dimensions

For Immediate Release:

June 1st, 2002

(St. Louis, MO.)-- In what could be considered an unprecedented move, the organizers of The Sixth Annual Atari Jaguar Festival have decided to broaden the scope of the event by showcasing not only the Atari Jaguar, but classic and next generation systems. Adding to this, Jagfest 2k2 will also provide an avenue for creators of "homebrew" software to show their creations to the world. Last years Jagfest in Milwaukee, Wisconsin set the stage by allowing non Atari systems to have a limited presence. This year that idea will be taken further by making their inclusion official.

James Garvin, owner of OMC Games and a principal organizer of this year's Jagfest, states: "Jagfest symbolizes what can happen when a group of gamers actually care about their games, and it has survived this long because of dedication from its community. Our goal is to insure that Jagfest will survive for years to come, and to do this the concept of what Jagfest stands for can be expanded to include gaming in general. The "Jag" in Jagfest won't be lost, though. It will still retain a major presence in the show, but gamers of all types should be able to share some of the same heritage that has kept the Jaguar alive after all of these years. This change is just a natural progression of the show."

Daniel Iacovelli, Founder and President of The Atari Video Club and co-organizer of this year's Jagfest also states:" The addition of old school and next generation will add a new dimension to the event. My club has seen the progression of this event since its start in 1997, from just Atari Jaguar and Lynx being shown at the first event to the addition of classic systems shown at the last year's event, it just seemed natural to continue from that plus extending it to new dimensions".

The Sixth Annual Atari Jaguar Festival (dubbed Jagfest 2k2) is being held in downtown St. Louis, Missouri at The Mayfair Wyndham Historic Hotel. (806 St. Charles Street St. Louis, Missouri 63101. Phone: 314-421-2500) on Friday, July 12th and Saturday, July 13th 2002.

For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com ,Daniel Iacovelli at atarivideoclub@yahoo.com or JT August at starsabre@worldnet.att.net visit the Jagfest 2002 site at http://omcgames.com/jagfest

(be sure to visit the Jag fest message board and post your ideas for this event.)

END PRESS RELEASE

June 4th, 2002 - Midwest Classic Host Large Display of Vintage Computers

Let the Midwest Classic take you back to the glory days of personal computers, when people had choices beyond a Windows or Macintosh based computer. Sponsored in conjunction with the Classic Gaming Museum, the Classic Computing Museum features a large display of 8 bit and 16 bit computers from the industry's beginnings in 1975 through to the last days of the 16 bit computers in the early 90's.

Of special note this year is a large section devoted entirely to Atari computers, and will include many hard to find Atari peripherals in their pristine condition. Visitors will also have the opportunity to leave their mark on this historical event by stopping by at the Atari 400 Guest Station, where they can enter their name and a personal saying for other visitors to read.

The Classic Computing Museum will have a large selection of items on display for visitors to see, learn about and play.   Each display will contain a small description and history of the items in the display. Not all items on display will be playable. Classic computing expert and ClassicGaming.Com editor Marty Goldberg will be on hand to answer visitors questions and guide them down memory lane.

"I look forward to exposing people to a rich and vibrant history they may not be aware of." said Marty. "Likewise," he continued, "those who are old hats to the subject will be pleasantly surprised as well by the extent of the display. Definitely something for everyone."

More information about the Midwest Classic may be found at the Official Midwest Classic Web site at the GOAT Store, LLC (http://www.goatstore.com). Dan Loosen can be reached at loosen@goatstore.com and Gary Heil can be reached at heil@goatstore.com for more information on the event.

Hello Folks,

it is my second Cry for help. My Atari SH205 will not comunicate with the AtariST. It comunicates with the controller with SH205 but not with the harddisk. The cable from Atari i put in Input of the HD. I start the Harddisk, wait about 1 minute (thanks Robert) the green harddisk-light will shining for a while and the controller yellow light shows the comunication between Atari and harddisk-controller.
But nothing else. The driver AHDI6061 not will be loadet and tells back ASCI devices Unit0 Identification unavailable. All tree dip-switches are ON.

If i work with driver AHDI301 and try to format i get the Message Fatal Error first. Then the Software starts and i click to Unit0, then SH205. The program try to format the disk, but before i get anather Fatal Error and thats all.
But if i put a jumper to the jumper-ledge J7 between A B HDX starts without the first Fatal Error. That 50% less. But for the other 50% in need your HELP.

```
PU .
T   ..  R     this should be J8
S    .
 and that J7            A C EG I KMO and the Jumper on the Harddisk Seagate
ST-225  : : : : : : : :  ?
                               .  .  .  .  .  .  .  .
                               .  .  .  .  .  .  .  .
                              B DF H J LNP
```

My question is how must i configure the jumper-ledges???
May be you can open your harddisk an make a photo of your configuration and send it to deuler@web.de

Many Thanks Daniel

If it's a scsi device it needs to be terminated, is it? On physical hard drives there are usually a few jumpers which do this, you should be able to find out info on just about every hard drive ever made (within reason!) on the internet - look to the manufacturers web site or do a search for you make + model. Alternatively you should be able to use a scsi terminator block which connects to the spare scsi port on the outside of the hard drive case.

Also check the address, as every scsi device must have a different address (1-7), there should be a jumper set with A0, A1, A2 or similar; these will be binary coded 1,2,4 so that you make the address number using one or more jumpers.

I don't personally know anything about SH205 hardware, this is just general scsi stuff.

I have an 520 ST with Tos 1.4 and 4 meg ram upgrade.
It does not recognize the Floppy drives and usually crashes with 3
bombs, when I boot from the Hard disk. The Ram checks out OK
when I test it. So im replacing the DMA chip ?? do I need to change
the floppy controller chip ?? What could cause the address errors of
three bombs.Thanks

Bud

the SH205 drives, yes *all* of them were MFM drives, not scsi. The only atari produced external hard drives that had scsi drive mechs were the Megafile44's which used the Syquest SA555 drive mech.   Hard drives on the ST still cause the most confusion among users. Just in the past few months I've seen some pretty wild claims made about them incluidng one that any atari hard drive could handle almost any style of hard drive mech. Another pair of users I knew locally a while back got confused about it too. One kept insisting he had a 1gigabyte MFM drive (which is outright impossible) and another had an ESDI drive that he thought was SCSI. I think its long past time we atari users put together an accurate Hard disk FAQ.

Well I replace DMA chip and the crashes stop but the floppy is not
there. Where is the Floppy controller ?

Thanks

Have you tried pressing down on all the chips. I had a ST that did the
same thing and pressing down on all the chips resulted in a good boot.

Hi Jonathan,
If thats the very early one (STM 260) which I think is what you may be

describing its more collectable than most of the STFM 520's and 1040's And sell on E Bay for around the twenty quid mark. Ive only seen 2 go on E Bay in the last month or so and both went around that price, one with box fetched about a tenner more.

Cheers
Chris C

There is software for RS232 cameras, but that won't help you. I do not
know of any such software for that type of camera. The only solution I can
think of would be a SCSI PC card reader. Depending on the unit, you
might need an adapter, assuming your camera has removable media.

>The floppy is an old single sided belt driven 400K drive (chinon F353AT)
>with an adapter board labelled C025913 that sits between the drive and

This adaptor isn't necessary with later drives. You'll be able to plug the
ribbon cable from the Atari's motherboard into the back of a replacement
drive along with the power cable - throw this adaptor board away.

>The floppy port supplies both DS0 & 1 Signals, does this exist in all
>models?, do I have to set the drives both to DS0? or can I use an

You'll have to set the replacement drive to DS1, or use a cable with a twist.

> If I am stuck with the internal floppy drive, does anyone have a recommendation for a 1.44 drive that will minimize modification to the ST case.

You should search out Hallvard Tangeraas' modification using a Sony drive - in the archive he describes how to change the faceplates. This is a very good and clear document with diagrams on what to jumper etc.

Cheers

Derryck

Hi,

I'm looking for any kind of ACSI specification - especially one whit data
transfer cycle and command cycle timings. I'm going to design some ide to
acsi adaptor (normal ide drive, some logic, microcontroller, etc) so i
could use any ide drive as native atari acsi drive..
it's going to be freeware project, so if anyone finds it intresting then
please help me searching for this acsi specification...

I am one of the organiziners of the upcoming Jagfest that is set to be held
at Saint Louis,Missouri on July 12th and 13th. We are currently changing the

direction of Jagfest from Atari only to Gaming in general,(classic and next gen). We are looking for peoplewho develop home games to attend.
If anybody on this list is intersted e-mail me or contact greg george at greg@ataritimes.com.

be sure to visit the jagfest 2k2 site at http://omcgames.com/jagfest
thank you
Dan Iacovelli

Hi all

yup the big shoe boxes were MFM drives, then Atari moved to RLL drive mechanisms as the MFM, due to it's architecture, are limited to size.

```

Hi!

Does anyone have any information for this, what was it designed
to run, DOS? I have been kindly given one and like to play
around with it.

On the hardware side is it mapped into the address space on the
ST, can it bus master? It doesn't have any BIOS or ROM onboard
so I assume this is loaded into the ST RAM with software. I
imagine then that programs that access hardware direct, without
using the BIOS will fail. Looks like it has an async connection
to the ST too as it has a 32MHz crystal divided down to 16MHz
that I think feeds the AMD 80286 chip. I'm going to install it
this weekend I think and try the software that I found at Vezzs
site (it was for the megabus version but guess it'll work still)

Sponsors announced for Jagfest 2002

For Immediate Release:
June 14, 2002

The organizers of The Sixth Annual Jaguar Festival (dubbed Jag fest 2k2) are pleased to announce
the current line of sponsors:

Atari Jaguar Directory:
an online directory listing of Atari Jaguar owners from around
the world. E-mail: Randy@atarijaguar.net
Website:http://atarijaguardirectory.com

The Game Trader:
A St. Louis area video game dealer that sells classic and
contemporary consoles and games. Located in St. Charles, Mo.,
at 2 Hawks Nest Plaza.
Directions: Directions: I-70 to Highway 94, south to the South Outer Road.
Turn right (west), go one half mile from 94 to Hawks Nest Plaza at the
Hawks Nest Drive overpass. Phone:1-636-723-0072.

Good Deal Games:
An online video game retailer that provides games for classic and orphaned
systems. Their website also provides information on video gaming past.
Michael Thomasson, President
Website: http://www.gooddealgames.com

Songbird Productions:
An online video game retailer and developer of Atari Jaguar and Lynx games.
Their store also hosted the third Jagfest in MN.
Carl Forhan, President
Website: http://www.songbird.atari.net

Telegames:
An online retailer and direct mail of video games for various game systems.
They also develop Atari games for the Jaguar and Lynx like Zero 5,
Breakout 2k and Worms for the Jaguar and Dessert Strike for the Lynx.
Telegames was also one of the first sponsors of Jag fest.
Address: Telegames, PO box 1855, Desoto, TX 75123
Phone: 1-972-228-0690 E-mail: Sales@telegames.com
Website: http://www.telegames.com

Trade n Games
1057a Gravois Road, Fenton MO. 1-636-349-3113. Trade n Games is
located on the bluffs off Gravois (the s is silent) overlooking
Fenton, Mo. Reseller of video games from Pong to Gamecube.

If you represent a business that would benefit from advertising in the
Jagfest program or appearing

in the festival's dealer room to sell your product or offer live demonstration,
e-mail Greg George at greg@ataritimes.com or
JT August at starsabre@att.net for additional details and a pricing schedule.

For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin
at omc@omcgames.com, Daniel Iacovelli at atarivideoclub@yahoo.com or JT August at
starsabre@att.net or visit the Jagfest 2002 site at http://omcgames.com/jagfest

(be sure to visit the Jag fest message board and post your ideas for this event.)

Or could be dry solder joints - old well-used electronic equipment (and
some new!) suffer from this. The best thing to do is to be very handy
with a good quality soldering iron, suck away (with a solder sucker, not
your mouth!) the old solder and replace with new. Be sure not to use
too high a temperature as it could damage the chips.
Alternatively find a junked Atari with a good motherboard and swap em
over (with your upgrades if required)

>>
>
>Most of these only did CGA emulation. I guess they would run Windows
>3.0 (possibly not 3.1)

I looked up on google archives and it seems that people have
said that it runs windows 3.1 with quite a nippy speed.  But
some of the answers to the questions below would be very helpful
:)  Pity the old 286 is soldered as I believe some boards were
made to use 486 in a 286 socket, and these days, you'd be able
to pick one up next to nothing.  Just trying to think what I can
use it for :)  Maybe some DOS apps.

Sorry I can't help any more. I gave all my Atari Mags that might had had some technical info in away a long time ago.

Hi, should be 5 volts, use a multimeter to check the polarity....i.e check
the centre pin against sheild and see if it is open or closed circuit.

Mark

You could whip the case off and trace the wires - should be easy to find the info you want.

I'd _guess_ at centre pole positive, but do feel free to check...

Cheers

Derryck

Hello to everyone,
I have a 1040 ST and a 1040 STE, both with power supply burn. I gave both them to a friend to try repairing them, but, while waiting for an answer....
As far as you know, isn't possible to use a common PC power supply with my 1040? The voltage seem to be the same, 5 and 12 v., with some grounds...
I have no problems about the size of the PS, considering I want to mount the 1040 in a 2U Rack.
Any idea about this?

Thank you
Fabrizio

One more warning point. Most AT PSU's do not like being switched on with no
load. So if you want to check the voltages make sure you have the outputs
plugged into into something.

Oh dear.

I've just dug my old ST out of the cupboard (a 520STfm, 4Mb RAM, T16 accelerator, 1.4Mb Floppy etc all in a tower case with an SM125 monitor) to discover that it's hard drive has died.

It was a Seagate ST296N drive on a Supra host adaptor. Now I'm wondering if it's worth keeping the Supra interface or getting a new more modern host adaptor.

What's the biggest drive the Supra host adaptor (and software) can handle? I've got a stack of small (500ish Mb) IDE drives knocking about - would it be cheaper to buy a new IDE interface instead of trying to get hold of another SCSI drive?

How does the performance of the IDE interfaces compare to ASCI?

Oh, and I've just realised that I added an OMTI 3520 controller to the system years ago though I don't fancy using MFM drives anymore.

TIA,

MikeW

Hi

>You could whip the case off and trace the wires - should be easy to find the
>info you want.

Yes, they usually go to a electrolytic smoothing capacitor with
the polarity marked on it.

>I'd _guess_ at centre pole positive, but do feel free to check...

I've never understood the purpose of using the wrong pins, using
the inside as negative. Just causes more problems when you do
come across old equipment with no external markings.

Hi Mike

SCSI drives are the best choice for ST's these days, have been for years. There is one ide host adaptor from Mario becroft in new zealand which also has a TOS 2.6 upgrade as well I think. But since you say you used a scsi drive before, it will likelyh be less expensive to dig up another scsi drive. Where I live (toronto canada) its fairly easy to pick up a 2 gig scsi drive for $25 with the smaller sizes costing even less.

This is true, but I think it is only picky on the 5V line--or, at least,
loading the 5V
line is sufficient. I used to power my floppies and a HD with one. I had
to load
the 5V line. I believe, from what my father had told me, the need about a
1A load
on the 5V line to fire-up. I used a large (> 5 watt) 5 ohm resistor from 5V

to
ground. I bolted it to the power-supply case so that the fan blew air
across it.

Hi Mike,

>It was a Seagate ST296N drive on a Supra host adaptor. Now I'm wondering if
>it's worth keeping the Supra interface or getting a new more modern host
>adaptor.

Can you find one second hand? Small SCSI drives go quite cheap,
although not as cheap as the IDE versions. I wouldn't know how
large the Supra adaptor supports on disk size, maybe 1 GB?

>What's the biggest drive the Supra host adaptor (and software) can handle?
>I've got a stack of small (500ish Mb) IDE drives knocking about - would it
>be cheaper to buy a new IDE interface instead of trying to get hold of
>another SCSI drive?

A second hand SCSI drive will be cheaper than a IDE adaptor.
There were a couple of IDE adaptors, IDEal and Mario Becrofts
one. There were some made by C't I think but not sure.

>How does the performance of the IDE interfaces compare to ASCI?

My IDE drive on my STE is very good, don't see it being slow I
think 1.5MB/sec max. But, maybe under multitasking system

ASCI/SCSI is better as it supports DMA, where IDE in Ataris
don't.

1A seems a lot. Anyway, the only PSU I've had problem with was
the Falcon one. All my old AT ones seemed to work fine without
load. An HD should give sufficient load for a PSU.

It didn't on mine, but there always could be variations. I probably didn't need to add a full 1A load, but I did need some load as I did run just the floppies at times. I could turn on/off the HD separately.

My original problem was with Aniplayer freezing during a video or
audio file from the cd-rw drive.Aniplayer did not have this problem
when the file was on the hard drive.

PLEASE NOTE I HAVE NOT YET CONTACTED ANODYNE SOFTWARE ABOUT THE
FOLLOWING PROBLEMS.

When creating audio cds I have no problem with just 1 track everything
goes fine.When I try creating a cd with two or more audio tracks
that's when I have trouble.During the second track the following might
occur.The CD-RW writing light will no longer come on.CDWriter
basically freezes and I have to do a ALT-SHIFT-DEL boot.
OR During the second track I will get an Alert telling me try a lower
speed even when I'm at the lowest I can go.

Sometimes after a complete simulation during the actual writing I will
receive the speed to high alert

Thanks
Mike

Hi;

I suppose one can still find somewhere on the Net the schematics for an
EPROM programmer by Pera Putnik, with accompanying software. Or else I can
send them to you... (I didn't build it, just have the files...)

As for the components needed for Pera Putniks's device:

Make sure you do not have some screen saver or TSR installed that
might interrupt the burning process. I have had great success
with the Anodyne software myself.

assuming the C-Lab Falcon is basically a normal Atari flacon ( ST-style
case, etc ) with the fixes C-Labs implemented ( as far as I can gather ) -
how much are you looking for?

Does anyone know the rating of the fuse on the internal PSU ?
```

Reading the ends it's rated at 240V (as I'm in the UK of course) but the F2L bit puzzles me as they're printed with 2A for 2 amps.

Is it a 2 amp rated slow blow?

Many thanks,

Richard Brooks.

Thanks Robert!

The Atari is not mine and used by a mate as some sort of music studio editor.

He said it went "pop", I looked inside and was surprised that for the first time in history they've finally designed a computer power supply whereby the fuse is not protected by the other components.

In the past I've had to send PSUs away with a perfectly safe fuse as supplied new by the manufacturers but with other components burnt out.

Invention, eh? ;-)

Richard.

Just for the sake of humoring me and/or seeing if such an idea is even remotely possible, would anyone here mind doing a short 30 second "spot" animation along the following guidelines:

1) Dark (black) screen; the only sound is the distant high-pitched sound of someone having flatlined.
2) Suddenly, "Beep!" (very faint image of the Atari logo in grey); more flatline. Atari logo fades to darkness.
3) Another beep. (Atari logo reappears, more clearly now, and with a hint of color). Flatline.
4) The beeps get closer together and louder, and as the do, the Atari logo grows clearer and more colorful.
5) The beeps are now backed by a strong heartbeat and the Atari logo appears steady in all of it's colorful glory.
6) The words and narration of "We're back!" appear.

Don't ask me why I'm back clamoring about this crap again. It's probably the fact that Amiga, Inc. is alive (with AmigaOne computers and AmigaOS 4 in the wings) and Atari Corp. is dead and gone that has me all bothered. Maybe it's the fact that *BECAUSE* Amiga, Inc. is back, I figure "WHY THE HELL CAN'T ATARI COME BACK?" There's really NO reason!

I will present this animation to Infogrames along with a serious, well-detailed business plan. The worst they can do is say "No."

Needless to say, I figure this animation would be spread via the Internet, not shown on TV (too expensive).

If they say "Yes.", here is a snippet of what the preliminary gameplan is:

You've seen those cheap little handheld touchpad thingies that hold dates and Email addresses and such? They're usually well under $50 and many times are $20 or so. There was one in grey that made me REALLY want it (just as a mock idea for what I'm thinking about). There was one for only $11 that even had a QWERTY keypad!

Imagine if such a device were "evolvable" (feature upgradable). Suppose there were about 5 or 6 different ones (maybe more), with different functions. But, you could "evolve" yours to have the features that someone else's had (shared evolution), just by putting them together (I'm thinking IR communication would be neat, but an interface cable could be nice too). You could also do a 'straight across trade' of functions (you get theirs and they get yours) You can also download new features/games from the special website when you had maximized your "Evolutionary Cycle" (obtained the features of all the different models). It's a tool! It's a toy! It's... BOTH!

And it's from Atari!

This would be, but the first step, towards restoring Atari as a hardware company and getting it out of the utterly meaningless "labelville", as it is today.

Jared

Hi Richard

Hm!, something doesn't sound right there, i suspect that the fuse must have been short circuit before it blew.

Hello Lonny,

Yes, I heard you mention that before. Where did you purchase it and how much? Explain the operation and just how it hooks up in the Hades. I assume it hooks up to the PCI bus, correct? I could use something like that to backup my Mint partition since Extendos does not function too well under Mint.

Hello Jared,

I would just wait for the new Coldfire Atari-clone computer to come out and get that. Or pick yourself up a Hades060 like me. Someone was selling one not too long ago. The company Atari may not be around, but there are plenty of followers still alive and kicking.

It's hooked to the scsi bus. The machine sees it as just another HD on the chain. It's best described as working like a zip drive but with no moving parts whatsoever. It works with the usual the HD software as is. No special drivers or PCI cards required. I got one on the TT as well. I can format a card on the Hades, load it full of data, pop it into the TT, power up, click the drive icon and read/write it like any HD. Just like a HD you need only format it once.

The 880mb card cost me $211.50 on ebay. The scsi readers vary, I've got several now ranging from $26, $45, to $100 for a dual card reader.
I've got 2 dual units in my hades, for a total of 4 pcmcia slots.
Goto my web page for a snap shot of my TT and a list of all my goodies.

With adapters I can read compactflash or sony memory sticks and smartmedia just as easily. Smartmedia and compactflash I've actually tested, in fact that is how I get the images off my camera, like in 2 seconds! ;-)

I agree you are clamoring crap. Might be the first sane thing you've ever said. The name "Atari" means nothing these days, it's a silly marketing tactic and frankly since it almost always denotes "games" or "gaming" I'd prefer to be rid of it.

Well buy an amiga then... do something more than yap...

Just as side note, I actually registered a plate for my car as "MR ATARI". Sure I thought it was cool and so did a few people on IRC who are into Atari computers. However, in the real world, driving through town, at work, nobody here gets it. I got funny looks, and even laughter. I got comments like 'oh i remember the 2600' or 'you must be heavy into games'. Not one person at work has a clue about the computers. ;-(

Trying to inform them only made me appear to come from some other planet. If I have to explain it, something is wrong. Totally not the image I wanted to project, needless to say the plate on the car is gone. I replaced it with something more personal, something not game related. See my web page for a pic of the car with yet another plate. ;-P

Just to educate the masses about Atari computers would take a media campain so huge and expensive, the likes of which even microsoft has never seen!

If you sit back and think about it, only the people you really know even know about the computers, it's either cause they are freinds with similar interests or they are family members who watched you grow up on them. Once you branch out, outside this small circle most people are utterly clueless.

Sorry Steve, it was a kind of a joke.

Later PSUs had "crowbarring" a term I assume came from the railways whereby
the guardsman carried a crowbar in his van and in case of an emergency would
have to drop this across the live line and earthed line to trip the ciruit
down the line.

Before that even the IBM PSUs would crap out leaving the fuse intact.

I am talking of the days when one had upto 4 colours on screen and had to
wait ages for the on-screen memory check!

Richard.

>As for the components needed for Pera Putniks's device:

I know of this one but the Junior Prommer is a lot easier to
build. Maybe it has more features, I haven't comapred the two.
Also the software maybe better for Junior Prommer, I'd be able
to use it on my PC and ST.

Sorry I don't want to sell the Falcon or 1040 STE just yet.
The only things I am selling are the 520 STM and 1040 STF
I'm still in the process of sorting out suitable packaging should anyone
want to have something posted to them (postage paid for by buyer!)

What is so desperate about having a Falcon, if you don't mind me asking?

> Thanks Bud,

I connected a CDROM drive (external) to my Falcon no problem, just like an additional external hard drive. I downloaded a special CDROM driver (probably a boot app, I don't remember) from an ftp site, but it was a few years ago so I don't remember where.
By DMA connectors I assume you mean SCSI 1 ports? You should be able to just chain to this external hard drive without another adaptor, as this should serve as an interface to the scsi chain and not just one device.
You need to make sure the CDROM is terminated (usually a jumper on the CDROM drive itself) and that the hard drive is NOT terminated, and that

both devices have different SCSI addresses. (jumpers on the hard drive/CDROM drive, or a switch in the external case if wired up correctly)

Hope you can understand all that, and that it helps!

what's so desperate? well a couple of things - I'm trying to set up a midi studio, having used Atari and apple stuff when I was younger, I preffered the Atari kit... I like the specs of the falcon and the greater RAM, internal disk, etc... and I wanted one a whole lot more as a kid and could never afford one - kind of allows me to fulfil childhood dreams and a gaping hole in the MIDI setup in one fell swoop... :-)

It's often a policy not to give out employee info or ex-employee info such
as address and telephone number. They could of at least gave a name so you
could do some google searches.

Hi everyone,

I have a few questions that maybe somebody can answer.
1) my falcon has an network connector can I get him to my home network and share my cable internet?

2)does anyone know where to find drivers voor a HP DJ850 for SpeedoGdos and some fonts for Speedo

I hope somebody could tell

Thanks,

This connector is for AppleTalk. Assuming your home network is TCP/IP and Etherent then you will need an Ethernet Adaptor. I think the solution at http://hardware.atari.org/ will work in the Falcon, but I have only tried it on an STE and a TT. There are other options such as SCSI adaptor and In which case try
(http://www.anodynesoftware.com/ethernet/main.htm has some info)

I got a DOS software here: http://www.hobby-elektronik.de/page11l.html
the link to the zip seems dead now, but if you want it I can ul it
somewhere.

Apparently not- read carefully the original post. It appears that his box is one of those which have two atari-dma (ACSI) ports on the outside, (one input and one output, possibly with some buffering inside) the purpose of which is to daisy-chain several ACSI (not SCSI) devices.

On the other hand, he says that the cable *in the case* has a free connector. This loks like a description of a cable with a free SCSI-connector inside the box (though AFAIK one should not leave unterminated pieces of SCSI cable dangling around in the circuit). If there is indeed a free SCSI connector in the box, that is the place to connect another device.

>You need to make sure the CDROM is terminated
>...

All your other remarks on termination etc. are quite valid.

AFAIR, those interfaces can drive at least 2 units - my ICD Micro-I-
don't-remember-what could only handle 2, and perhaps can Bud's adscsi+
handle up to 7. Anyway, he only wants to ad a cd-rom unit, so just
has to plug it in the free connector, and maybe recase the whole
stuff (unless the original case can handle both HD and CD-rom).
Don't forget to set the ID to 1 (IDs > 1 may not work with some
DMA-SCSI stuff). As driver, you could use Betados + Spin, which IMO
are better than Metados.

Good luck,

J.-Luc

I quite understand :) So you will understand why I don't want to sell
it just yet ;)
I'm sure there are better falcons out there than mine - I always wanted
the 14MB Falcon Wing ram upgrade but could never afford it. Got an FPU
though :D

This is where the plot was lost and I don't think the above was my text.

The joke (first typed by me) was based on manufacturers PSUs that seemed to be designed to destroy any other component in that PSU and save that little glass tube with the metal thread and this happened without (pardon the pun) fail.

I did not write the above paragraph where the plot was first lost.

Richard.

Anyone could get one of these devkits, I got one directly from Atari
and I never was a big name game company. In fact I had 2 identical
devkits, sold one for next to nothing. They are horribly out dated
and most of that stuff is on the web if you look hard enough.
Good luck!

No it was my text, and yes this is where you lost it.

> The joke (first typed by me) was based on manufacturers PSUs that seemed to

And my reply referred to the fuse having been short circuit prior to the fault.

Tell me, what is the resistance of a working fuse??.

Yes but it's niiiiiice to have. ;)

Couldn't you see it on your book shelf? You could dust it daily, in the
sound knowledge that you're preserving a piece of Atari history...

But if you read my original post I had 2 identical devkits. I still have
an original devkit neatly arranged on my book shelves preserved in all
it's glory. I was registered with Atari and got updates, I'll be it minor,
just a few extra news letters came along before they went bust.   ;o)

Hello,

I intend to build a cord for connecting my Falcon to a TT via SCC,
but I don't know which pins are relevant.
Can this be enough :

```
   3->-\/-<-3
   5-<-/\->-5

   6->-\/-<-6
   8-<-/\->-8
```

or do I have to do this too ?

```
   1->-\/-<-1
   2-<-/\->-2
```

Thanks for any answear,

J.-Luc

Hi all,

More or less ever since I have had this Milan I have had a problem with the sound system.

It works perfectly most of the time and then suddenly with no error message and with no obvious cause it stops working and there is no more sound output.

For example. If I play sound files via Aniplayer it suddenly stops making sound but otherwise it continues playing files as though everything is working. The only hint of a problem comes from the percentage indicator in the Aniplayer window which starts displaying values like 15%, 109%, 14%, 127%, etc.

It's not just Aniplayer that is affected though, once the sound system is broken, GEMJing is silent too. I have found that I can usually cause the problem to appear by moving the slider in the Aniplayer window but it also appears when using GEMJing.

The only thing that fixes the problem is a reboot which obviously re-initialises something.

I feel that the problem is in the software between the application and the hardware. I tried upgrading to a later version of the MilanBlaster software but that made no difference.

I increased the amount of ST-Ram to 14Mb as I read that using less could cause problems with the Soundblaster driver.

I am using Mint and NAES 1.2, do either of these have any affect on the sound system?

This may be unrelated but I see on acp.atari.org that there is a new pci-bios for the Hades is there any benefit in using this on the Milan?

All ideas gratefully received.

Regards,

Peter

PS
I have been having a lot of problems with NGs via my isp
so I am trying my back-up isp. I hope this works.

Hi, I want to make a St 3,5� drive cable,
Anyone makes this?
if possible?
How i make, Instructions, Pins Diagrams?

Thanks so much

Cesar

Does anyone know the eprom used for the 2 chip set of tos 1.4?
I know that the 27c256 is the eprom used for the 6 chip set.
both I know are 28 pin.

Thanks in advance
Al

Look up best electronics website in a search engine or email them at bestelec@concentric.net

I got the 6chip set of TOS 1.4 there last year and I know they also have the 2 chip sets as well. Best is pretty good for this stuff. All the parts I've ordered from them over the years have been spot on.

Hi Cesar.

it is possible to build one but the connectors are uncommon. Best electronics in california stocks them and the fully assembled cables too. There are some other mail order places that would have these but I cant' remember them off hand. But if you email bestelec@concentric.net or use a search engine to find one of the other ST parts dealers you should be able to find the parts. In my case I needed 3 or so of those same cables last year. I saved myself the effor of assembling them and ordered the full cables. Does cost a little bit more that way but at least you'll know they will work right away.

Folks,

Seeing as Lyndon has still not finished making any adaptors, I thought I would have a go at making one myself.
After a few over-heated fingers I now have one up and running. I have documented my experiences (very roughly at) http://www.dwade.freeserve.co.uk/atari/main.html and would appreciate any feed back.

I must say I am very pleased with the adaptor, I tend not to use it on the net directly, but I stage the files on my PC then FTP them to the ST, mainly because CAB seems very slow at rendering compared to my PC.

Dave.

P.S. In order to preserve what little un-soldered areas there are on my fingers, I am now waiting for Lyndon to make me another one so I can get my MEGA on the net as well.

Funny that you say that.
I received the adapter from Lyndon 2 weeks ago. All the way from UK and I am living in the other side of the world, in Singapore. The adapter looks some what similar to the one on your web page.

Irony is that I seems to have some difficulties in getting a RTL8019 ethernet card, the near by second hand shops don't seems to have them. It will be sometime before I can make my way down to some other 2nd hand computer shop (second-hand mean Pentium II era stuff nowadays). So I have not hook it up yet to my falcon.

Rgds
William

1 megabit 128Kx8bit. 100ns
There's several different numbers depending on who made/makes it, but
the most common are 27C010 and 27C1001.

YOPu need 27C010, 27C1001 or similar. However, these are 32-pin and need
some adapter to plug into the 28-pin socket.

There is no 28-pin EPROM that is pin-compatible with the original ROMs.

Just a Reminder about Jagfest 2002 on july 12th and 13th in Saint Louis,MO:

Admission cost for this event is $25.00 for those who wish to pre- pay and $30.00 for those who wish pay at the door; this cost covers for both days.

Table prices are as follows (admission price is included): Visitor tables: $35.00 before July 9th (after July 9th its $40.00),

Dealer Tables: $45.00 before July 9th (after July 9th its $50.00) (extra tables are $5.00 each).

Also for those people who want to place an ad in the fest program here are the prices:
$15.00 for quarter page
$25.00 for half page
$50.00 for full page
A listing on the back page is under $15.00
For full details on how to place your ad in the program contact Greg George.
You can pay either by paypal (greg@ataritimes.com) or by sending a Check or Money Order to Gregoary D. George, 347 Banyan Drive, Winter Haven, FL 33884
Attn. Jagfest payments
For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com or Daniel Iacovelli at atarivideoclub@yahoo.com or visit the Jagfest 2002 site at http://omcgames.com/jagfest/
(be sure to visit the Jag fest message board and post your ideas for this event.)

----

like to help spread the word on Jagfest2k2 e-mail me (atarivideoclub@yahoo.com) ask about getting the Jagfest Flyer to pass out at your area.

I would like to have a hard disk for my STE and I have been looking at previous posts to see what can be done. There seems to be 4 options available to those who want a hard disk. 1: Get an actual hard disk for the Atari off Ebay. 2: asci-scsi adaptor (Does this connect to the hard disk port on the back of the STE to some external scsi hard disk?). 3: An IDE interface in which you can have an IDE hard disk inside the STE. (requires a tos of 2.06 I understand). 4: Link 97 solution to a PC (is this just a cable and some software?).
I want a hard disk that doesn't require soldering inside my precious STE, so what is the easiest and cheapest way to do this other than buying the ST hard disk? Could someone tell me the full details of whats involved in the last 3 hard disk solutions or mention any web sites that give all this information?

thanks for reading

I'm not going to bother posting this to the other newsgroup

Alex

I have had a better look on the web and have come across a FAQ for this
group. I now know there are only three ways to connect a hard disk to the
ST. The most suitable for me think would be the SCSI host adaptor
(Link'97,The Link2) but they are a bit pricey at $100 whatever that is in UK
squids.
Oh well.

>1: Get an actual hard disk for the Atari off Ebay.

This will connect to the port on the back of the ST. Many of this are very
small
(30 or 30 megs) and have MFM or RLL drives which may be starting to die.
Unless you can get one really cheap I would avoind this.

> 2: asci-scsi adaptor > (Does this connect to the hard disk
> port on the back of the STE to some external scsi hard disk?).

Yes thats the idea. These convert the Atari Hard Disk port
which is a kind of "cut down" SCSI to full SCSI, and allow a
some standard SCSI disks (and other SCSI periperals, depending
on model) to be used on the STE. In the uk Atari Workshop may
have some of these in stock. (www.atari-workshop.co.uk but I can't
seem to reach it from two different ISPs.)

> 3: An IDE interface in which you can have an IDE hard disk inside the STE.
> (requires a > tos of 2.06 I understand).

Only requires TOS 2.06 if you need to autoboot. Will boot fine from a floppy
with TOS 1.6. I did not fit mine and have not looked so I don't know how
much
soldering is involved, but I think many just clip over/under the CPU chip.
I got mine from Keychange (www.keychange.co.uk) but Mario Beecroft
also does one (see http://gem.win.co.nz/mario/hardware/ide.html) which
requires
little (no) soldering.

>4: Link 97 solution to a PC (is this just a cable > and some software?).

It is a ASCI <-> SCSI adaptor as above.

> I want a hard disk that doesn't require soldering inside my precious STE,
so
> what is the easiest and cheapest way to do this other than buying the ST
> hard disk?

If your STE is an early model with a suspect DMA chip you may well
have to replace this to implement a SCSI adaptor. This is a much bigger
job than fitting the IDE adaptors.

> Could someone tell me the full details of whats involved in the
> last 3 hard disk solutions or mention any web sites that give all this
> information?
>

I think I have covered most things. Note if you want to use
other SCSI peripherals then you may need the ASCI <-> SCSI adaptor any way.

You might also check out http://www.seimet.de/hddriver_english.html for
details
of some modern driver software.

Ahah Atari Workshop is back up. �59.95 for the link 97.
Then you may need to get the DMA fixed......
Compared with 35 quid for the IDEal from keychange....

Two that I know of.

1. Take theST appart and check the number on the chip. If it says

CO25913-38
PH23-030
9H1 80

Its bad, but I don't know what a good one says.

2. Plug in a ICD ASCI adaptor and use for about 1 hour. If the drive starts to loose data its bad.

You might also try posting the serial number.Mine which had a bad one is A19B3007210. I also think if you have the later TOS 1.62 (which does the Medium Res thing properly) you are probably o.k.

Dave.

Hello,

Maybe is this the correct place to post...
I'm getting into trouble in configuring the jumpers of an Atari TT-RAM expansion.
This is fitted with 4 SIMMs that are to be 2 MB ones. But, when the TT boots, it only reports 4 MB of TT-RAM instead of 8.
I suppose I have to set jumpers on the board, but unfortunately i don't own the doc. There are 6 jumpers labeled W101 to W106 on the board. Can someone tell me how to configure them regarding to the number and type of SIMMs one can use ?

thank-you,

J.-Luc

Ah ha, I have found the TOS chips, found underneath the floppy disk drive. And I think I have found the Processor. It's the one on the right in a black socket with the line 68000FN8 written on the middle of it by Motorola. What on earth is the middle socketed chip and where can anyone possibly stick a

2'5 hard drive?!

Ok, the serial number on the bottom of the ST case is A10BA3042961 and I
have TOS version 1.62

Well I had a peek in mine to see how Barry had squeezed it in and it fits
in very
sidways at the back, just over the video socket.

If you have not found the DMA its under the floppy...

CECCOLI Jean-Luc <Jean-Luc.Ceccoli@wanadoo.fr> writes:

: Hello,

: Maybe is this the correct place to post...
: I'm getting into trouble in configuring the jumpers of an Atari
: TT-RAM expansion.
: This is fitted with 4 SIMMs that are to be 2 MB ones. But, when
: the TT boots, it only reports 4 MB of TT-RAM instead of 8.
: I suppose I have to set jumpers on the board, but unfortunately i
: don't own the doc. There are 6 jumpers labeled W101 to W106 on the
: board. Can someone tell me how to configure them regarding to the
: number and type of SIMMs one can use ?

: thank-you,

: J.-Luc

2 MB is not listed as a possibility. 1 MB and 4MB are listed.

For four 4 MB x 8 SIMMS, W101 is jumpered 1-2, W102 is jumpered 1-2, W106 is jumpered 1-2

For four 1 MB x8 SIMMS, those three are jumpered 2-3.

W103 and W104 are jumpered 2-3, and W105 is jumpered 1-2 for non-burst mode, and 2-3 for burst mode. That probably means jumper 1-2, unless you can get burst-mode SIMMs.

Jim

What is the difference between the Link1 and Link2 from ICD? And what kind of cable will I need? I have also noticed a Gaestiner SCSI Link, is that just as good?

Well I have two different 1040ST MB's one says Rev 1 and has a spot
for a blitterchip on the MB the other has a slightly different chip
layout and says Rev D. Which one is newer ? The Rev D MB has Tos 1.4
on 6 chips and the Rev 1 has 2 Tos Roms and says Atari 1987 on them.
Judging by the Roms I think that the Rev D has been upgraded ?

Thanks

The age old story:))

There are several revisions, i would say that rev d is the latest you
have.

Both motherboards should be able to support either 2 or 6 rom set

Strange!!! I know several people that have used standard 27 series EPROM's in the 6 chip set???????

On the same subject... a while ago I had a chance to speak to the developers of the EPROM programmer I have for my Atari. They also stated that it is simple to make an adaptor to allow programming of the 32-pin 27 series EPROM, using a 28-pin socket. However that you will need to MANUALLY switch the high banks.

Has anyone made one of these or got one for sale?

Please read the original article. He was asking for an EPROM replacement for the *2*-chip set.

>On the same subject... a while ago I had a chance to speak to the
>developers of the EPROM programmer I have for my Atari. They also stated
>that it is simple to make an adaptor to allow programming of the 32-pin

>MANUALLY switch the high banks.

You will have to switch a *lot* of banks. 27C512 (the largest in 28 pins) and 27C010 use different kinds of applying Vpp/program pulse, due to the pin shortage on the 27C512, so you will have to set the programmer for 27C256 (or even smaller), which means you need at least 4 banks to switch manually.

Unless, of course, you can modify the software to drive the prommer.

I use the Junior Prommer, and the 32-pin adapter for that programmer does everything without manual switching, since the software directly supports the adapter.

cu
Michael

Hello Alex,

I also have a STe and have a hard disk up and running. I used the Link II SCSI interface and it works just fine. I also have a CD ROM hooked upto it.

I suspect the Rev.1 board you mention (with 1987 rom) probably contains the TOS 1.2 roms. Functionally there isn't much difference between the same verision of tos weather its on 2 or 6chips other than the obvious that the 2 chip set is easier to replace with a newer version.

Hello,

I recently came across an Atari 2600 model CX-2600. I currently do not have any carts for it and would like to know if it is working before I bother purchasing any games that I may find.

I'm just wondering if anyone can tell me if the Atari should display anything on the television if no cart is in the unit. Currently, when I connect the video cable to the RCA jacks in the television and turn it on, nothing indicates whether it is working. No flicker in the video, no static, nothing.

Any suggestions as to what I may be doing wrong, or if I really do need a cart just to see if the unit will power on, would be greatly appreciated. Also, any information on a web site or source for Atari 2600 Repair would be nice.

Thanks!
Peter

Hi there,

First off you need a cart to display anything, otherwise the system wil not work at all. Secondly the rf cable coming from the 2600 is NOT composite video, you need one of those tv/game switchboxes to connect to the antenna (or cable) connector on the back of the tv, usually the 2600 will use channel 2 or 3, there is a switch on the back to select which.

Seems I'm missing the TV switch, but I believe I know where to find one.
Thanks for the quick reply and help!

Peter

Hello,

Back from a while away. Basicly,. I didn't want to participate while my =

Atari was broken down...

but now I think I really f*cked-up... Here's the problem...

I wanted to install a 1.44M drive in my Atari STe. All went well, but I =

had no switch in it for 720K. So I created the auto detect circuit. With=
=20
one of the chips missing, I had it replaced by a simular chip. And then =

the trouble started... The curcuit didn;t work, so I replaced it with a =

manual switch and taking 8Mhz and 16Mhz from the MoBo. When booting the =

Atari in HD the drive was not detected. When booting in DD mode, the=20=

drive was detected, but unable to write to it.

I figured that it would be a problem with the 16Mhz signal since I have =
a=20
Ste. SO today I had time to buy a 16Mhz crystal to do the job. Soldering=
=20
it all together, all shoudl work. But the problems stayed. I changed=20=

drive, but this dind't help either (twice to be exactly, even a Sony=20=

drive refused to work).

So I think I've blown up the FDD chip. Am I right with that thought?

Though nothing is lost... An old Mega ST 1 is coming my way, along with =
a=20
MegFile 30...

Alex

You don't absolutely need the "RF switchbox"- its only purpose was to allow people in the 1980s to switch between the antenna on the TV (this was before cable TV was common) and whatever device they wanted to connect to the TV- video game, home computer, PONG, whatever.

You DO need some kind of adapter to convert from the RCA plug on the 2600 to whatever kind of antenna input your TV has.

The RF switchbox generally did that by converting the connections to two "spade lugs" that screwed under the VHF antenna screws on the TV.

You can get an inexpensive adapter that does the same thing, in case you can't find a "genuine" RF switchbox.

You can also get an adapter that will connect to an "F" style cable input in case your TV doesn't have screw terminals for the antenna (some TVs don't have them any more).

Then just tune the TV to Channel 3 (or whatever the 2600 is set for).

As for repairs, the cost of repairing a 2600 is likely to be far greater than just buying another one from eBay or Salvation Army thrift stores. They're not very repairable, and replacing the chips on the motherboard (IF you can get them) is very labor intensive.

Check on eBay for game cartridges too, if you can't find any at thrift stores or garage sales. There are a lot of people selling them pretty cheaply at eBay.

Good luck!

BobR

Ok Peter, shouldn't be too hard even these days. I've even seen them in those dollar stores on occasion (the equivalent to the old five and dime shops)

My Atari ST doesn't detect my drives most of the time, Hard or Floppy
Drives. Then all of a sudden it will work for no apparent reason.
Sometimes it will detect just the floppy and not the Hard drive.
If if does detect them both there is no errors during usage. But then
I'll turn it on later and it will not be there. Should I reseat any
chips or any recommendations. Atari 520 ST Tos 1.4 4 megs.
I am starting to lose my mind.........
Thanks, Bud

Sounds like contact problems with DMA and Floppy controller, if they are placed on sockets on mainboard.

Regards, Robert

The DMA drives both floppy and hard drive.  Sounds like you done
something to the DMA.  Check for any dropped solder across pins,
or small pieces of wire left inside.  Revert back to how the ST
was, remove the HD upgrade and try the old floppy drive again.

What I meant is Hard Disk Drive not High Density.
The only upgrades are the Xtram Ram deluxe and the Tos 1.4 chips.
If I was to find the DMA chip to reseat which would that be ????

thanks

I found it and reseated it carefully, and no change, could it be bad.
????
I discharged static and wore a static strap to ground. Is there any
other chips perhaps that I should reseat or replace as I will order
from Best Electronics. Any other advice?

thanks

Hmm not certain, think it's to do with addressable size of HD.....
Geastiner Link was a SCSI interface form Geastiner (hmm?) all i know is it
works but I haven't heard people jumping up and down about it.

Hi

So does anyone know its worth? I have a few Atari STs I should clear
out, they're taking up too much space and I don't have time to use them
all!

For reference, I have the following setups:

Atari STe 2MB
Atari Falcon 4MB 500MB internal, 500MB external hard drives
Atari 520 STM
Atari STFM 1MB
Atari SC1435 monitor
External drive x 2

Would like to keep Falcon and one ST, and try to get some money for the

rest rather than giving them away. Money buys new toys, but I see Atari
STs quite often at car boot sales going for next to nothing so I'm not
afraid I'll never see one again!

Potentially worth a lot to someone who wants to use Notator or Cubase...
;)

Jonathan,

You have answered your own question. You see standard STs
at car boot sales and on Ebay or QXL for small amounts of cash, so
apart from the Falcon, which you want to keep I would say the rest are
worth virtually nothing.

Perhaps the STE might be salable as they can have the memory upgraded
simply, but they can have disk trouble.

As for the rest I think you will be lucky even to give them away.

Dave

Hello!

Got my Link2 up and running and I must say it works a treat! Had to buy a few bits & bobs from Maplin though.
Anyway, I would like to know what would be the best set-up ideally. Should the error map be best on SCSI or FAT? Should I enable parity checking on my SCSI hard disk? and stuff like that to get top performance. I have set-up one 32MB boot-drive and four 200MB BGM type drives Any advice is welcome.
Any web sites for this sort of thing?

Alex

Big thanks to Derryck.

An ST useless!!!! What a load of ccccrazynesss.

Where are you? With the words like carboot sales, i can only presume you
are in the UK, but arent sure.

I'll pay postage on ANY atari software/hardware/books etc rather than
see them dumped (unless they need dumping).

Who knows maybe one day i'll make my venture pay:)))

I think something went wrong upgrading my 1040STe drive to 1.44Mb...

I followed the schematics as they were. Find the WD1772-02-02 pin. Find =

the 16Mhz from Pin 2 on the 144-pin processor. Loosen the pin on the=20=

WD1772-02-02 and connect the hole from the 144-pin processor to the pin =

from the WD1772-02-02.

All went well, and then..? For some reason I'm not able to read/format=20=

the 1.44 drive.

I used an old Mitsumi drive for tis purpose, and I switched it to drive =
0=20
(a very old drive, but it works). Then I connected the media-change pins=
=20
as described and the HD switch with pin 2.

The overall result? The drive is recognised by my 1040STe (I get an=20
format option) but inserted disks are not read, and can't be formatted.=

Any hints?

Alex

I'm not living in the UK, so I suppose you'll add postage as well. But=20=

then again. 20 pounds (postage included) is quite a lot of money for an =

old mouse (don't know if I saw the mouse on your site or someone else's)=
.

> Yes, you can order the convertor from NZ.

> Don't forget to add postage and currency charges, as discussed here
> recently.

> Then post to let us know the total>

I'm not sure how much that'll be, but I'm considering it. If I've ordere=
d=20
it (and my Atari lives to see the light after the 1.44 blues), I'll let =

you know.

Alex

Hi Barrie,

>Then post to let us know the total>

I bought mine as soon as I saw it available, from Criss
Crosskey. Not sure if he still stocks them or whatever. I also
bought a mouse for it, only �1 IIRC!

Hi Derryck

>>Adspeed sold vey well, someone should have the drivers here.
>
>Shouldn't need any software, isn't it controlled with a switch?

It's mapped into memory map, so I assume only way to change it
is to send some data to it. It was somewhere in the middle of
the ST chip registers, up at the top end of the memory map. I
remember it collided with IDE, but didn't give compatibilty
problem I don't think.

Ok, take your WD back to 8MHz by connecting the clock pin to
where you pulled it up from, out of the board. Try using a DD
dick, it should work, if not, your floppy drive has problems.

Hi Michael,

>Correct (unless you want to come here and pick one up, I might be able to
>dig out some of them).

Would they consider giving the VHDL code away? I now working
with VHDL with CPLDs and FPGAs and that would be useful, but I
would fully understand if they didn't want to.

Thanks.

You guys are right after checking it out more it does recognize the
524K but not the Xtra Ram deluxe 2 MB that I paid 200 bucks for from
Toad .
I was booting it with my Neodesk 4 boot disk and it bombs with a
insufficient RAM error. Well there does not seem to be any thing wrong
with the XTra Ram thingie at least visually. I reseated the simms and
made sure the cables were tight. Anything I else I should check ?
supposedly that was one of the good Ram upgrades as far as quality.

None of my good proggies run on half a meg :(

Thanks for all the help atarikid@cox.net

Want to laugh? I've taken an other drive from an old PC I have (I have 3=

=20
old PC's, thus 3 drives, but I didn't get this one because it was tightl=
y=20
screwed to the case), re-jumpered the drive-select and plugged it in... =

The most funny part of this all is that the drive is from an unknown=20=

brand (Alps Electric Co. Ltd). So now it's time to get the button on the=
=20
case of the 1040STe and re-solder the connections so that I have a=20
720/1440Kb drive available.

Alex

I do not have a STe but, if I remember correctly what I have read somewhere, 16MHz signal is not "clean" on this machine and it is much better to use a separate 16MHz oscillator for the floppy. Besides, AFAIK at least the MEGA Ste has to have a certain version of a GAL chip in order to be able to use HD disks directly- I do not know if STe has this capability or you just made a small one-chip or two-chip 2:1 multiplexer board to switch from 8MHz to 16MHz and vv.

Speaking from experience with a MegaST, hoping that it applies to a STe:

- In order to use a HD floppy, step rate has to be changed (by software) to 6ms; with a doubled clock for WD1772 it will become the correct 3ms again; otherwise you end up with 1.5ms step rate for HD floppies which the drive can not reliably follow (warning: with 6ms step rate and DD floppies you get an awful but harmless noise from the drive).

- One can not boot from a HD floppy unless there is a special boot sector on it, with a routine that sets the step rate immediately.

>I used an old Mitsumi drive for tis purpose, and I switched it to drive
>(a very old drive, but it works). Then I connected the media-change pins
>as described and the HD switch with pin 2.

You should check with a voltmeter whether HD-detect for that particular drive is active HIGH or LOW. Some drives output this and some that, and it may be the opposite of what the HD circuit expects. Also, on some drives you have to set a jumper in order to get any output on pin2 at all.

Unfortunately I don't consider a kludge that plugs into the CPU socket via pins sticking out the bottom of the board as a "plug-in card".

If this is how the Magnum ST operates, I'd have a lot of trouble trusting it.

The only memory upgrade (standard 4Meg) I ever used that I considered reliable required you to solder a small pc board to the BOTTOM of the motherboard, under the CPU socket.   Still a kludge, but at least a reliable kludge.

The first "plug-in" memory upgrade I used came with a piece of string to tie the board down so it would stay in the CPU socket. I ended up keeping the screws out of the computer case so I could easily pop the top of the cover off and press the board back down into the socket when it "migrated" back up out of the socket. Oh- it also came with some pieces of double-sided "sticky tape" to help keep the board from wandering around inside the case. Maybe the Magnum ST is improved.

>be used for quite a range of additional hardware. The original ST was quite
>"closed".

Yes, the higher level Atari computers DID have a true expansion slot, so Atari could tout that in its advertising.

However, a 3U VME slot was almost useless for most computer owners.

The few specially designed Atari related VME boards were VERY expensive, and VERY FEW of those "thousands of available VME boards" (the argument Atari itself used) were of any use to the typical Atari owner.

In all my discussions with Atari people, none of them could ever tell me WHY they went with VME instead of a more useful expansion bus like ISA. The best any of them ever could do was that they wanted something that was different from what IBM PCs had.

That's great if you do high-speed data collection with your computer, or need to control a Wide Area Network (things well represented by the VME community), but not very useful for the average Atari computer owner.

Sorry- just some cranky old memories dredged up.

The design was done in MachXL, not VHDL. I can ask Uwe, but I guess no.

It does - The board has precision-machined pins on the bottom that are made just for the purpose of being plugged into a precision DIL socket, and I can assure you that they give good contact - much better than some 4MB cards that plugged directly into the PLCC socket of the MMU chip, ruining the pins of the socket.

>The only memory upgrade (standard 4Meg) I ever used that I considered

Huh? What's the difference if you solder on top of the CPU or on the bottom side?

Doing it on the top side makes it easy to plug the board under the CPU in case it is already socketed, and otherwise you can simply solder a DIL socket on top of the CPU, which is easy, fast and reliable.

>The first "plug-in" memory upgrade I used came with a piece of string
>to tie the board down so it would stay in the CPU socket. I ended up

Sure you are talking about the CPU? That one is not even socketed in a normal ST.

|
| Do I have to be a virgin? as we may have some problems there.

The new member bit would qualify yourself, as few newbies admit to being
cherries anyway!!, except for James that is, its mentioned on his business
card in the local phone boxes..

Hi Reizla

I think something went wrong upgrading my 1040STe drive to 1.44Mb...

I followed the schematics as they were. Find the WD1772-02-02 pin. Find the 16Mhz from Pin 2 on the 144-pin processor. Loosen the pin on the WD1772-02-02 and connect the hole from the 144-pin processor to the pin from the WD1772-02-02.

All went well, and then..? For some reason I'm not able to read/format the 1.44 drive.

And what happens when you revert to the origonal state??.

I have a Apple Scsi 350 MB 3.5 HD from 1994. I was wondering what kind
of connection or case I would need to connect it to my ST. I need an
external case right ? I need an adapter from Scsi 1 to Acsi ? and
Drivers I imagine. Any thoughts where to get the components ?
Can I use this Hard Drive ?

Thanks Sean,

Hi atarikid

| You guys are right after checking it out more it does recognize the
| 524K but not the Xtra Ram deluxe 2 MB that I paid 200 bucks for from
| Toad .
| I was booting it with my Neodesk 4 boot disk and it bombs with a
| insufficient RAM error. Well there does not seem to be any thing wrong
| with the XTra Ram thingie at least visually. I reseated the simms and
| made sure the cables were tight. Anything I else I should check ?
| supposedly that was one of the good Ram upgrades as far as quality.

Something is odd here, most memory expansions require the internal memory be disabled, there were some mods that allowed 2 1/2 meg , utilising the on-board 1/2 meg and the expansion 2 meg, but that required a small TSR to switch it in, i should ask questions along this line.

Steve,

With the Xtra-RAM you are able to get 2 1/2 megs without a the TSR as long as
you dont have the 100109 MMU. If you do you needed to replace it. There are
other memory upgrades that use 2 1/2 megs also with out a TSR. I know the
Zubair, Newell, Xtra-RAM deluxe, and the Tech-specialities memory upgrade did
2 1/2 mes with out a TSr accourding to the manuals.

Don

<stevesweet@freeuk.com> wrote:

Steve,
I never used a TSR or boot loader with this upgrade. I opened it up
and checked it out. The Ram upgrade card with the Simm slots
is glued to the side of the interior and two cables come off from it,a
13 pin and a 10 pin.
The 13 pin goes to the center of the Mainboard near the CPU and has a
square little board attached beneath with pins on three sides. I
removed this and carefully pushed it back in place.
The 10 pin cable goes to the right of the board and is attached to a
little card that has a long chip on it.(Inside a box)This chip is
attached to the mainboard. I removed this card with a chip puller and
blew the dust and reseated the pins carefully.
Additionally there is one ground wire soldered to a little aluminium
box on the edge of the mainboard.So I reseated the simms, replugged
the cables,and reseated the connections to the board. Still the same
amount of memory is shown 524,288K I think. There was no
software sent with this upgrade. It's been several years stuck in my
mother's garage, but it was boxed nicely. I do know how to
troubleshoot PC's, but my ol Atari i'm kinda lost.It was I think Xtra
Ram Deluxe upgrade.

Yes, you're right- sorry, I was talking about the MMU socket.

It's too bad the corporate mentality at the time didn't give us
anything better to work with. Atari wasn't the only one, Amiga and
Mac weren't any more "open" than the STs were at the time.

While I was never very satisfied with the long-term reliability of many of the solutions, I do have the utmost respect for the creative people who have found ways around that corporate mentality and gave us capabilities Atari never dreamed of.

One Atari rep actually told me they never imagined anyone would ever require more than 1 Meg of memory, so making the MMU with enough address lines to do 4 Megs was seen as a "gift" to the users.

I know he's most likely not still around, but I wonder what he'd think of the Magnum ST board.

Most likely you can connect this drive like any other SCSI drive. In this case a host adapter like the ICD Link or (better) the LINK96/97 is required.

Depending on the type of EPROMs your going to use in the STe, there are some jumpers you need to configure. Since TOS 2.06 is 256K bytes in size, it can be split across two 27C010's (or a 128K x 8 equivilant EPROM).

From the STe schematic, here are the jumper settings:

Jumper W102	pins to be jumpered
27256	Don't Care
27512	2 and 3
571001/27C1000/531000	2 and 3

27010/571000/27C1001	1 and 2

Jumper W103 pins to be jumpered

27256	1 and 2
27512	2 and 3
571001/27C1000/531000	2 and 3
27010/571000/27C1001	1 and 2

Jumper W104 pins to be jumpered

27256	Not connected
27512	Not connected
571001/27C1000/531000	2 and 3
27010/571000/27C1001	1 and 2

To aid in indentifying the jumpers (I don't know if the silk screen is there or not to label them) here is what pin is connected to what:

W102
Pin 1 to GND
Pin 2 to pin 24 U103 (ROM chip)
Pin 3 to U100 pin 48 (68000 A17)

W103
Pin 1 to VCC (+5V)
Pin 2 to pin 3 of U102 and U103 (both ROM chips)
Pin 3 to U100 pin 49 (68000 A18)

W104
Pin 1 to U100 pin 48 (68000 A17)
Pin 2 to pin 2 of U102 and U103 (both ROM chips)
Pin 3 to GND

You should have everything there to help develop a mod.

Hi Michael,

>>Would they consider giving the VHDL code away? I now working
>>with VHDL with CPLDs and FPGAs and that would be useful, but I
>>would fully understand if they didn't want to.
>
>The design was done in MachXL, not VHDL. I can ask Uwe, but I guess no.

OK, no problem then, as porting a design from Mach XL might be
as difficult as designing my own. I have some example codes in
VHDL for DRAM controlling.

Thanks anyway.

Hi,

>I do know how to
>troubleshoot PC's, but my ol  Atari i'm kinda lost.It was I think Xtra
>Ram Deluxe upgrade.

Yes, that was the Xtra RAM Deluxe.  Have you tried using just a
couple of simms?  I can't remember the banks now, but if you
play around it should work.  Is there some soldered wires on the
motherboard near the PSU, conencted to some resistors?  If so,
the bank on the ST would have been disabled.  Don't use 2.5MB!
I once tried it on my STE, and some games refused to work.  4MB
or 2MB was fine though.

The 2.5mb works on the Xtra RAM deluxe and work well. Ive used it on a few systems without any problems. According to Manual the Deluxe as not to be used in a STM due to the size of the deluxe upgrade. It may be a Xtra-RAM or Xtra-RAM+2

That's different as the STE interprets 2.5 MB as 4 MB, so you need a small software hack (set som registers and reboot) in order for it not to crash.

Hi,

>Yeah, right. I've seen a 2nd hand mouse in the UK... 20 Pound! For that
>amount I can order the convertor from the guy in New Sealand and have a
>PC mouse...

Depending on where you're located in Holland, it might be worthwile to make a daytrip to Germany and visit the Peter Denk Atari shop. They've developed a keyboard & mouse convertor which is far more sophisticated and even works with the new bunch of IR mouses and keyboards. The convertor, new mouse and keyboard costs 44 Euro. Shipping to Holland is 4.95 Euro.

Peter Denk has the largest stock of used Atari hardware and software in Germany, it's like the cave of Ali Baba :-)
If you're looking for i.e the Magnum 16Mb memory expansion, this is the best place to find it. If what you're looking for is currently out of stock they will put you on a waiting list and notify you when the wanted goods are available....

Check out http://www.atari-fachmarkt.de , you can also subsctibe to a weekly mailinglist there which keeps you up to date of what's new...

Cheers from Belgium
Dennis

Hello,

I would like to know if it is possible to use a Riebl ST ethernet board together with a MagnumST card in a Mega ST 4? (The magnumST card is a 8MB (in my case) memory expansion set which uses SIMM memory + TOS 2.06 upgrade). Both are connected onto the Mega Bus. I'm afraid that both cards want to use some overlapping memory area between 4MB and 14MB because the system won't boot (black screen) if I turn it on with both cards (with one card it's OK).

best regards,
Dennis

Okay, as told. I found the right 1.44Mb drive to work with the 1040STe. =

Now there's a new problem...

When I connect the drive to the 1040STe, nothing's wrong. I can read the=
=20
drive (track 0), and write it when I've loaded STEP_HD.PRG. Just like al=
l=20
should be...

But when I close the cover of the 1040STe and reboot it, the drive isn't=
=20
detected anymore?!?!?

Anyone has a clue on this problem?

Alex

Hi Reizla,

>But when I close the cover of the 1040STe and reboot it, the drive isn't
>detected anymore?!?!?

Sounds like a short to shielding, try leaving that out? Perhaps
when you screw floppy in place, the ribbon cable is bent and not
quite making a good contact with connector?

A short to the shielding? That's almost impossible. The ribbon is twiste=
d=20
a 180 degrees, and makes good connection (why did Atari ever make the=20=

ribbon so short?). And the drive was already screwed in place.

Funny thing is that when I closed the cover, but removed the drive-front=
,=20
the drive worked normally... I think internally the drive was a bit=20
screwed... I've been toying along with the front (removing all holding=20=

parts and the alike), and now it works with the front in place...

But please don't ask me what I've done... I don't know, but it works... =

;-)

If you know what you are doing, it is no big deal.

The problem in small CPLDs like a Mach210 is that you have to use
asynchronous logic for some signals to get the right timing, since a fully
synchronous design does not fit and/or is too slow for the device.

The MagnumST used the address space from $00400000 to $00BFFFFF. I am not
sure about the Riebl card - if it lives at $00C00000, it should work, if it
is below, you are in trouble.

The MagnumSTE has a jumper to limit the memory to 6MB for such cards.

Hi Michael,

>The problem in small CPLDs like a Mach210 is that you have to use
>asynchronous logic for some signals to get the right timing, since a fully
>synchronous design does not fit and/or is too slow for the device.

I will be targetting the Altera Max 7000. I'm using one of the larger ones, as I need a lot of I/Os, I'm going to throw some other bits inside, ISA, IDE, and act the 68000 on waitstates. I was going to use the 68030, but the only thing that stops me is the PCB layout! It's very difficult, as I see it. I don't know how they made the PAK, I seen the photos of the PCB, surely it's 4 layers?! I only have access to two layer PCB maker. I know most of the steps on using the 68030 in 68000 enviroment. The Falcon is quite useful in that respect :)

With 68030, I was going to buy from Czuba a PGA one, good for 50MHz. With some 60ns EDO right next to it, with it's 32bit data path close to 50MB/s could be achieved, although, some waitstates might be needed ;) Anyway, a 68000 would be good to try. Another advantage 68030 has is the proper co-pro support.

Back to reading my VHDL book I guess....

It is. Doing this on a 2-layer PCB might prove difficult - for a one-off project, you might get around to wire VCC and GND with solid wires, at least in some areas.

Or make a proper layout for VCC and GND, put in as much signals as you can get, and wire the rest.

cu
Michael

Yeah, I can get down to 2 tracks between each 0.1" pad spacing,
but it's still very difficult. I'd rather not wire too much.
I'm going to try with a 68000, as I can first program the CPLD
for 8MHZ mode, then built up, remembering not to go over about
100 versions as they loose their ability to be reprogrammed soon
after. Once I'm confident with CPLDs, I can get on with other
projects, perhaps using a 68030.

The 1040STe needs 30 pin modules without parity although parity wont
harm. Maximum is 4 MB if you supply 4 1MB modules.

I recently picked up a 1040ste.

When it boots it doensn't recognize either the internal or external floppy drive.

First the light on the keyboard for the internal floppy comes on and then the drive light for the external floppy lights up. After the desktop appears, the internal drive light on the keyboard flashes dimly, about once per second.

Anyone have have ideas as to the problem? I know both drives are good, they work with a 1040STfm.

That's normal.

>Anyone have have ideas as to the problem? I know both drives are good,
>they work with a 1040STfm.

Does the icon appear on desktop? It could be a blown floppy
controller, or yamaha sound chip that is used select a few
signals on the disk drive.

Nothing appears on the desktop. I get the menu across the top, but no
icons. Most of the menu selections are grayed out.

Are the chips obtainable?

I might have a WD somewhere, and a yamaha but chances are they
are soldered on some old ST board.  Yours will also be soldered.
Unless you can use a soldering iron, you may be stuck.  Where
are you in the world?  Whats likely to stop the icons appearing,
YM or WD dead, anyone?  The YM sometimes gets blown from
printers. IIRC hewlett and packard used to draw a lot of current
from the unbuffered printer port.

I was in the midst of writing some e-mail, when my space bar died. Since I use this TT a lot, I had simply worn out its contact spots.

So I pulled out the milar, which is simple on a TT, and harder on other machines, and got out a little bottle of General Cement Nickel Print, which I keep in a refrigerator with electrical tape around its top, to keep it from evaporating too fast.

Applied one small drop to each little contact spot, waited overnight for it to dry, re-assembled, and all keys work well again. There were many that were worn almost-through, but the space bar failed first.

Jim

I'm in Cincinnati, Ohio, USA.

I'm no stranger to soldering.

My first thought was that it's the floppy controller since neither drive
connection works. Or is that works one way? The lights come on, but no
activity.

-Bob

I had a similar problem about a year ago with the used TT I had recently acquired. In my case it was the escape key first and then some others. But I went the other route, I had so many keys that were becoming intermittant I ordered a new mylar from Best Electronics. It costs more than what you did but it still revived my TT keyboard. Still its pretty good that those keyboards can keep going for a decade before needing any work on them. Not many other computer owners would have the same computer after 10 years much less expect that it would keep going as good.

For Immediate Release to all Internet and related groups!

The Classic Computer And Gaming(CCAG) Show 2002 is on!

The Classic Computer And Gaming Show 2002 will be held on May 25th, 2002 from 8AM till 2 PM. Vendor setup is on the 24th from 5:30PM till 9PM, and from 6:30AM till 8AM on the 25th. Show location is at the St. John Lutheran Church,
11333 Granger Road, Garfield Hts. Ohio, 44125.

Here is our own site for more information and current status of vendors and attendees.

www.ccagshow.com

Table rental is $5 this year, and admission is only $2. The admission fee will also allow you to be eligeble for a drawing at 1PM, the 25th, for an Arcade machine! (You will need a way to take the machine home with you!)

The web site, www.ccagshow.com, has site info, table layouts, map info, etc.

For you Atari fans, we have Nicholas Harlow of 16/32 Systems showing up! And for the Astrocade fans, we have Adam Trionfo of the Bally Alley site making his appearance! Lots of fun for everyone!

We hope to see you there at the CCAG 2002!

In my experience, 99% of the time this type of failure is due to poor electrical contacts. Many of the chips in the ST are plugged in to sockets and are prone to "chip creep", which means that they wiggle themselves out of their sockets due to warming (= computer on) and cooling (= computer off) cycles.

You could try the Classic Atari Drop method. Unhook absolutely everything, lift one side of the Atari about 6 inches, and let it drop on a hard surface (i.e., your desk). Do the same with the other side. Repeat as often as needed. I have often done this with my ST's and haven't lost one yet. (Note: I have never tried this on a Mega!)

If you are squeamish about doing this, you can always open up your ST and wiggle the chips back in by hand (watch our for static electrical discharge!). I had some RV friends who swore by this method and purposely left the cover and the RF shield of their ST unscrewed so they could perform this operation after a hard day of driving.

Hope this helps!

Randy Kwak

Hi Bob,

>My first thought was that it's the floppy controller since neither drive
>connection works. Or is that works one way? The lights come on, but no
>activity.

If the internal connector was around the wrong way, the floppy light on the floppy drive itself stays on. I'd try replacing the floppy controller first. Does the ST print, or can you not check this? The Yamaha also used for printing, as well as sound and floppy disk.

I have the computer taken apart on my workbench.

There's only three chips that are socketed: the two TOS chips and another one to the upper right of the OS chips. I have removed all three and re-seated them. This didn't help.

It doesn't look like I can get the floppy cable off easily. But, because both an external drive and the internal drive aren't respondong, I'm still betting on the floppy controller chip.

Are these readily available?

Look in the schematic and start measuring signals on the FDC connector -
some floppy control signals (IIRC DS0/1 and SS) come from the sound chip, *not*
from the FDC, and run through some TTL chips. Furthermore, the interrupt
signal from the FDC passes through a LS02 which can be shot from the ACSI
port.

Now to find a schematic. ;-)

I'll see if I can trace things, but I have no idea as to the signals.

should help.
The page hurts the eyes, but if you turn off images and custom colours in Mozilla, it is readable ;-)

The quality of the scans does not seem to be worse than my original, printed schematics.

Hi Bob,

>Now to find a schematic. ;-)

There is a link to schematics on my website, http://hardware.atari.org. But, if you can not get that, http://atarihacks.cjb.net has them, under docs IIRC. The drive A and B select lines are from the Yamaha, and so is the track one signal, or something similar. Access the drives and check these DS0 and DS1 lines. The DS don't feed through any TTL gates AFAIK, straight to the floppy shugart bus. I think I have a floppy controller, second hand if you're interested.

I'm just wondering if the large plug that comes of the atari laser printer controller, is just a video interface?

And as such, would it be compatible with the Video interface, that has the same plug on older SX based Canon laser printers, For which parts and cartridges are very easiliy available...

I will investigate

| This sounds like a very high tech repair method ;-)))
| (Yes, I've heard about this method before, but would never do it with my
| own equipment).

Its a completely crap idea that should be heavily discouraged.

And report back, please. From a SLM 804 book, that connector is a Fujitsu FCN-774J037-G/C, and what comes in to it is ST-bar, or Start, VDA-bar, or video data, AT/MN-bar, automatic or manual, and CONT-bar, or continue . That is on pins 3,7,13,34.

At the time, what distinguished the SLM printer from other printers was that the computer provided the memory, so the printer did not have to, and could be the very first laser printer that cost less than $1000 USD. I doubt that anything else about it was new. That was enough.

It would be no surprise if the SLMC804 could drive some other printers.

Cable modem, or DSL or ADSL usually require ethernet, so yes once you
have a reliable ethernet connection you could go broadband.
I think the BNC/RJ-45 issue can be solved with an adapter. My stuff has all
RJ-45 connectiors so I'm not 100% sure on that.
I bought a Dayna (JR-45) unit to put my TT030 on broadband. The Hades is
already on it and I can connect the TT to the router and share the
connection.

Hi, im in Perth west australia..

I picked up my SLM 804 & SLM 605 at my local recycling centre! picked em up for $5 each..

were destined to be shredded, melted and recycled into new wheely bins.

got most of my atari collection from there, except my stfm, tt & cdrom drive.

give me shout on ICQ: 130664852 if your in need of atari relaited advice...

just as i suspected, if its got video data going through it, then in some fasion a interface or adaptor could be created to conect the SLMC 804 to a Canon LBP 8 Mark III with the optional video card installed. I've seen these at my recycling centre also. and being a canon techy, i can fix them with my eyes closed. Now, i just bet that i wont even see any there for the next 10 years.

Yep!

Its a standard 37 pin video interface. all looks very positive. just have to
find one now, plug it in and try it!

haha, you can buy ISA video interface cards that let you use the Atari
lasers on the PC too!

> altogether different standards?

They may or may not be different. RJ45's can be used on both 10 meg
(ethernet) and
100 meg (fast ethernet). However most 100meg cards will also work at 10 Meg.

Also BNC is a "BUS" system like SCSI whereas RJ45 is more a star and needs a HUB or switch if you want more than two systems linked. (for two you can use a "cross over cable")

So provdied we are talking 10 Meg "Ethernet" the converting between RJ45 and BNC requires only electrical level changes. The protocols are all the same. To this end you can often find small 10baseT/RJ45 hubs which also have a BNC connection fairly cheaply. I have a "Netvin" and a "D-Link" both of which have this.

However you can not just plug a bit of coax cable between the two BNC connectors. They need to be terminated, just like SCSI. Somtimes the cards have small switches that allow this, but its more usual to get "T" (i.e. three-way) adaptors that fit onto the card or hub. The cards can then be linked with COAX and terminators placed on the free ends.

So it should be quit possible to convert the BNC cards for use with broadband provided via RJ 45.
You would need a small hub with a single BNC, one RJ45 patch lead, one Thin Coax Patch lead and wo BNC terminators. Hubs with a BNC are getting a bit scarce, but you should be able to find one.
I searched on UK googel for NETVIN and managed to find a few listed..

There are a number of gotchas. Some ADSL requires DHCP and I don't know if the software on the ST supports it. If the ADSL requires a browser with JAVA to configure that might also give problems, but I am sure there are ways round thesethings. (they might not be cheap though)..

Also some ADSL is not delivered as RJ45, in such as case you would may also need your own modem.
Som comes with a USB modem which won't work with the ST. However even here there may be a solution.
Vigour make devices which will allow many USB modems to be connected to an RJ45 based network without a PC...

>
> Any other comments to all of this?
>

The NE2000 based solution at hardware.atari.org might be cheaper...

If you use NextGenTel you can connect your STE directly to your LAN and get online. However, the Cisco router used by NextGenTel does not support BNC, only 10/100Mbps TP. So your LAN should support both BNC and TP if you want to use that Daynaport adapter. Hubs and switches with both BNC and TP costs a little bit more than pure TP ones, but not much.

When you have such a hub or switch, you simply connect the Cisco router to the uplink port on the hub/switch, and your computers to the other ports. Then set up the network the usual way, i.e. assign each computer a unique IP-address and set each computers gateway address to point to the router.

If you have Telenor ADSL or UPC cable it's not that simple. In this case you need a dedicated computer to act as a bridge between your LAN and the internet.

Hi,

I was wondering about the possibility of changing my TT from German to English.

Would it be legal for me to download a copy of 3.06(UK), burn to roms then bin my old 3.06(GER)?

Actually, first off, is it possible?

Regards

Tim

The cards supplied by me for EtherNEC have both BNC and RJ-45,
activity lights and error light.

Get PC/Mac online then use it to route to your Atari machine.
Sometimes an Atari can go straight on broadband, but there are
complications sometimes depending on what way the provider
connects you. I'm not sure, broadband isn't that common in th
UK. I think Mintnet has the best for direct connection to
broadband.

Yes its possible but its not easy unless you have access to an eprom burner and a set of eproms thats pinout compatible with the original roms. If you don't have an eprom burner then it would be easier to buy a set from someplace like best electronics or one of the other places that have a set of the original roms.   Another option is to use something like neodesk or some other desktop replacement tahts available in english.

LAN = Local Area Network. I'm not talking about the "LAN"-ports on the MSTE, TT and Falcon.

> Are there other ethernet adapters with both BNC and RJ-45 (the same as

BNC isn't used much anymore, but there are still a lot of PCI and ISA cards with either just BNC or both RJ-45 and BNC.

I'm not sure about UPC, but you should talk to your neighbour Geir �yvind V�lidalo which has UPC installed and use it with all of his computers, including his Ataris.

To share UPC broadband with several computers, you need one computer to act as a gateway to your local network. This computer needs two network cards, one to connect to the cable router and one to connect to your LAN. It also needs some sort of IP masquerading installing, e.g. ICS (Internet Connection Sharing) under windows.

As far as I know UPC cable access in Belgium, they use DHCP (which might be a problem on atari). in Belgium they provide a cable-modem with RJ-45 plug. (BTW never saw a cable or ADSL modem with BNC connectors).

> To share UPC broadband with several computers, you need one computer to act as a gateway to your local network. This computer needs two network cards, one to connect to the cable router and one to connect to your LAN. It also needs some sort of IP masquerading installing, e.g. ICS (Internet Connection Sharing) under windows.

You don't especially need a computer that acts as a gateway. You can also use a "broadband router". The SMC Barricade is a good example (+/- 175 euro). It has a WAN port (i.e. RJ45 port for the cable modem) and 4 LAN port connections (also RJ45).
If you want to share your broadband connection you need some kind of Network Address Translation tool. This is part of the Barricade and also needs to be installed on the "gateway" computer (Internet Connection Sharing and also WinRoute does this job).

I have a similar connection with cable-provider and a "gateway" PC. And it works fine...
Read more about my setup here :
http://gallery.uunet.be/saka/atari/reality/rtl8012.htm

BTW the gateway PC can also be a MAC... that also works fine... (nightowl has such a setup)

Cherio,

Yes, this is also an option, but you can get a cheap and Linux-capable PC
for less than this. But a proper router would probably require less work.

> Address Translation tool. This is part of the Barricade and also needs to be
> installed on the "gateway" computer (Internet Connection Sharing and also

Sounds fiddly. My Cisco ADSL router takes care of everything, I don't need
to install anything on my computers.

Ahh, hadn't thought of that!

What you're saying then is, I could install something like Mint in English
and have a virtualy English TT?

Now that would solve my problem.

Tim

I did just that (TT-Digger rules !) and it seems that a part of it is encrypted/compressed in some way...
But apparently all Fast-RAM init related code lies untouched at the beginning of the Flash code (which follows the standard TOS-executable format BTW).
I browsed through the memory test (interesting part :-)...) and it *seems* that a simple patch could be made to make a N-revision board work. But do not expect it to work on non N-releases then!

> > > Well if the memory-mapping is the only difference, perhaps some sort

> > > I will keep you informed of my "discoveries"...
>
> If I have some time this week I will try writing a simple FASTRAM.PRG
> program...

Tried to execute the following program at the beginning of the AUTO folder (I have a 32MB CT2B fitted:

```
 pea superb(pc)
 move #38,-(sp)  ; SUPEXEC ($26)
 trap #1  ; XBIOS
 pea 32*1024*1024 ; 32MB
 pea $04000000
 move #20,-(sp)  ; MADDALT ($14)
 trap #1  ; GEMDOS
 move d0,-(sp)
 move #76,-(sp)  ; PTERM ($4c)
 trap #1  ; GEMDOS
superb:
 sf $f7000000 ; 16/32MB SIMM CT2B (see CHPB)
 rts
```

... and it bombed (very randomly) my Falcon to death... well, until the next reboot!

Any hints??? I cannot believe that programs (and TOS) could be *that* incompatible to a $04000000-starting Fast-RAM block...

I wondered if it is an XFRB/_FRB issue... As HD-Driver is started after my patch, it does not know about the Fast-RAM being available, so I guess it sets no XFRB cookie... As for the _FRB cookie, I wonder if it is useful on Falcon too (I have a SCSI drive attached)...

Perhaps there also are other Fast-RAM related issues I do not know of...

Mmmhmm... (Just though about it:) Perhaps the PMMU-tree is not properly set for >16M adresses... Will check that soon...

BTW the adress-bit #23 of $F6xx0000 seems to control whether one boots
from Flash-memory or from ROM... So an emergency program to recover
from a corrupt Flash code should be easy to write! :-)

Not 100%, you sometimes get the odd message popping up that is not English,
plus install MINT in German is hard work as it then converting it to
English.

Some programs (such as HDDriver) detect that the machine is still German and
never work (although I hear you can put a switch with it that sorts it out).

I would go for the ROMs and be done with it, I found them cheap somewhere
and I also know a chap that will burn them for a small sum, mail me if you
are interested.

As for how legal it is, well I think it is illegal but then no one is going
to have a go at you for changing the ROM language on some chips you already
have, moreover on a machine that died 10 years ago.

Elliot...

Sounds good to me!
I might be way off the mark here but I asked a similar question a few weeks
ago on these groups and somebody got in touch offering something similar, I
lost the mail. Was it you?
How much and where should I send my money?

> As for how legal it is, well I think it is illegal but then no one is

Well, I must admit, I don't know if it is legal or not but I would stretch
more towards legal though, I mean when you buy software, you purchase a
license to use the software, not the actual software.

Anyway, I look forward to hearing from you soon with regards to the ROMs.

Tim

A Friend of mine had the same trouble a couple years ago, he already had neodesk 4 so he used that and it worked fine.

You may need to have some keyboard mapping. I remembered a German
colleauge's notebook had some keys characters swap.

He means a LAN, a local area network. The LAN connector was supposed to
connect to an Apple Localtalk LAN, but software support was never realised,
Right now, we're talking about an Ethernet LAN.

>> However, the Cisco router used by NextGenTel does not support
>> BNC, only 10/100Mbps TP. So your LAN should support both BNC and TP if you

Yes, there are but, I don't know if there are any of the SCSI kind which are
compatible with the ST. They're usually either/or. However, with something
like the EtherNEA and similar projects, which utilise an ISA card, you can use
cards with any kind of connector.

>> If you have Telenor ADSL or UPC cable it's not that simple. In this case

>having bought a networking card?

UPC/Chello uses a silly thing called PPP over Ethernet, at least last time I
checked with my mates who've had Chello, but the Norwegian implementation
might differ. You'd have to use a router as an intermediary, then.

Was a PCMCIA unit ever considered for building for
hooking up to the ST/STEs?
If this was done, could a standard network card
be utilised once a set of drivers were written?

Regards,

Mark

I'm no expert - but isn't there an option to write an emergency floppy disk from the NVRAM setup program? I've no idea what it's supposed to do though!

Cheers

Derryck

Hi,

This should be possible as PCMCIA is pretty similar to the ISA bus.
Drivers and hardware for ISA Ethernet boards is already available.

/Peter

Are you fellow atari users aware that amiga 500 & atari ST floppy drives are backwards compatible?

Well the ones with the industry standard connector, not the retarded small style connector some external amiga drives have.

found out last night when pulling apart my friends amiga and thought "what the hell" and plugged its floppy drive into my st and it worked instantly, internaly and externaly, aslong as the ID is set correctly, those pining for a floppy drive can rape amigas for them, because they work. but be aware that some 500's have 1.5 height 3.5 inch drives, and they do not have faceplates. Try to get a third party external 500 floppy drive with a regular connector, then its very easy.

is this known?

The ST's use a standard schugart interface, and use the same type of fdc
as in pc's, early Amiga (iirc) didnt use a standard interfafce, niether
did early ST's either.

But you must keep in mind, the easiest way to hook a PCMCIA bus up to an atari is through the use of a SCSI pcmcia adapter. A special drive will need to be written for these units before a (modified) version of ISA drivers can be used. It will be some work.

I would not like to use PCMCIA. PCMCIA cards seem to change chip sets
frequently
and are relativley expensive to obtain, so there is a real danger we would
end up in the situation
we are in with the Parralle Port adaptor. We have a driver, and a hardware
design but no
network adaptor.

The ISA adaptor Lyndon has designed at http://hardware.atari.org/ is I think
a near optimal solution.
It uses cheap and reasonably widley available components. It is reasonable
simple to build
There are drivers for some of the commonly used network stacks.

Even so I guess that ISA NE2000 clone network cards are not going to be
around for ever, so we will need a
replacment at some point in time. I would suggest that a PCI version would
be better as that
would probably offer better long term stability.

Dave.

Same as with a PoCs box dude, allows you to recover from a fried BIOS,
providing the BIOS boot block isn't also fried.

The SCSI to PCMCIA units I have strictly mimick a HD. The firmware in these
units is limited. The manual actually states one cannot use ethernet
or modems designed for pcmcia.   Perhaps there are more robust models out
there, but if so they must cost a fortune. The ones I have are not cheap,
but they do read any type of memory card quite nicely.

OTOH, if it's hooked up via SCSI, wouldn't that require more or less constant
polling? That's a suboptimal solution, just like the SCSI ethernet boxes from
Dayna.

Hello,

After soldering a lead from the 5VDC power connector to pin 26 on the
SCSI header of my Seagate ST-41200N, the Link2 is now getting power.
I had to do this because the HD would not term power to the SCSI bus
no matter which jumpers I set (vertical or horizontal).
Here's the specs for the ST-41200N:

<http://www.seagate.com/cgi-bin/view.cgi?/scsi/st41200n.txt>

However, when I run the ICD install program the Link2 is not
recognized and I get the following error:

No ICD host adapter -caching disabled!

This is my second attempt to connect a HD to my Atari STe without any
luck.
The first HD was recognized on boot after I set the proper jumper to
term power but was not recognized when I went to format.
Someone suggested using HDDriver instead of the ICD utilities but I
opted to try a second drive.

Why is the Link2 not recognized now when it's getting power as it was
recognized with the first drive I tried?

Please help!

I had exactly the same problem with mine a few nights ago.

It turned out that the termination was not active on the drive.

Took the jumper off, cleaned the pins, re-inserted the jumper, all was well.

TTFN

There I actually a number of options. I suggested Mario because he is the
same
hemisphere as you. The page is at http://gem.win.co.nz/mb/atarihw/ide.html

I actually have an "IDEal" from Keychange in my STE. The prime factor in my
choice
was that I live near enough to Keychange to be able launch it back through
their windows should I have extreme grief with it. They are at
http://www.keychange.co.uk/
and I must say that it seems to work "as advertised" so Barrie and his glass
insurance
company can sleep easily, but I don't currently use my STe much so I am
afraid I am not a
good reference.

This might change because I hoping to get an Ethernet interface for it, from
http://hardware.atari.org
but he says he is waiting new stock.

Sorry chaps I did not make it, wish I had.

Do you do things like "swaps", I have a few things which I can begin with,
namely for (as in the title) a Genius LAN adaptor.

Maybe I can make it to the next one, I will need to get home form work much
earlier though.

I hope you all had fun anyway, but what other stuff goes on?

Elliot...

I have installed Mario's IDE interface in a 1040STE and it works great. It was also very easy to install. It also comes with a TOS 2.06 upgrade. I did a little review you can check it out at:

http://www.qnet.com/~dons/

Looks like a TT-RAM test, right. And X means the test for that block failed.

The test should be present in TOS 4.04, only the needed variables are never
set during startup, so you will never see that test during a normal startup.

> insurance company can sleep easily

Thanks, Dave, in the unlikely event it goes t*ts up aim for the front
bedroom window, the units' blown.

I've just supplied three more IDEals and have some more in stock, also some
' small ' IDE drives.

As users will realise, these units are nearly silent so if noise is a
problem ask other users what they think.

Barrie at Keychange.

>I hope you all had fun anyway, but what other stuff goes on?

I brought a load of Atari stuff to dispose of, and Steve had his toolbox
open to sort a prospective member's SIPP problem.

HTML editing together with a demo of Hiwire and that was about it! :-)

Cheers

You can patch *everything*. How much of the original remains is a different topic ;-)

Hacking in TT-RAM support for hardware that has it (on the normal addresses, ie. $01000000 up) should not be a big deal - for the Milan, it was as simple

as setting the magic and end address variables (although we removed the
memory test in the Milan TOS - the Milan bootblock has already tested memory
when TOS takes over the system).

Hi Hallvard,

>Anyone have any views on this and/or can direct me to other websites
>with pinouts for ROM/EPROMs?

The manufactur of ROMs should provide a datasheet, with pinout
info. It'll be in PDf format. Big manufacturs of ROMs would be
AMD, Cypress Semiconductor and ST Microelectronics. If someone
wants to install ROMs, best thing is to get them in the right
way around, make sure HI ROM is in the HI socket (same with LO)
and install jumpers where the 0 ohm resistors are. I don't
think anything can be damaged like this.

Hi All,

I just revived an old Atari Mega ST4 (Powersupply problems..)

It appears to work fine now and has some interresting hardeware in it. Like a Reflex 1024 graphics card by Titan Designs and a ICD AdSpeed ST accelerator.

I'm looking for the software/drivers needed to use these devices.

Any help is welcome,

Zedd.

>accelerator.

Hmm, never knew Titan made a Mega ST graphics board? Is it ISA
adaptor, or custom chipset?

>I'm looking for the software/drivers needed to use these devices.

Adspeed sold vey well, someone should have the drivers here.

It's a mega-bus adapter. With a Texas Instruments TMS34061FNL chipset.
It should be able to do 1024x1024 on a SM124 (interlaced) and up
to 2048x2048 on monitors that support such high resolutions.
No color, only monochrome.

I hope so! I couldn't find any info or drivers on www.icd.com

I believe ICD last effort 6.5.1 (?) even though it doesn't state Adspeed
will manual work fine.

After that just use HDDriver.....

I have an adspeed driver, although mine is for 1040STe. The driver may be the same. I'll e-mail it if you like. Remember to remove the <nospam> from my address to reply.

I think you're talking about ICD SCSI or IDE interfaces here.
The ICD AdSpeed ST is a 16 Mhz processor upgrade for the ST. So I don't
think that HDdriver will work. ;-)

Zedd.

Ah, I just realised that Titan were formed after they developed
their first product, the Reflex card. Sounds powerful! 1024 on
a SM124 must make text *really* small!

>I hope so! I couldn't find any info or drivers on www.icd.com

Nah, their website hardly features anything on Atari. You could
poke some values in Basic if you really desperate. The
registers for turning bits of it on/off are in the memory map.

Ah, but my laptop (Dell) has a resolution of 1600x1200 on a 15.x inch TFT,
and I love it. Linux runs great on it. Though running StEem in a window is
a bit small when running a game in 320x200, but I can run a lot of them at
the same time :-)

I found them in the list. I didn't try it yet. I still would like a copy of
the original software. Though I read somewhere that the TSR sucks...

I also think it boots in Hi speed mode. It's a lot faster than my other
ST4. This behavior can probably be changed with a jumper on AB or CD.

Greetings,
   Zedd.

We're running a special on Motorola 68060 50MHz CPUs (FULL Versions, MMU &
FPU)
through May 6th, 2002. Perfect to take full advantage of the CT60
accelerator board from Czuba Tech.

Each 060 is only $79 plus $6 shipping (internationally!) including a 30-day
unconditional
warranty!

Order online at http://www.vernalelm.com or http://www.68060.com

If you have questions, e-mail us at sales@NOSPAMvernalelm.com (remove
NOSPAM)

Thanks for your time.

Hi all,
Ive got a 520 ST with 1.4 tos and an Xtra Ram upgrade done by Toad
Computers, but when I boot it up GEM comes up but has no memory???. .
I dont see any loose simms or fried traces on the motherboard. Also
the Xtra Ram deluxe seems securely fitted., could it be the MMU chip
or something ? Any advice would be appreciated.
I have a backup 1040 ST but I need my machine for my music.
I am not proficient enough with electronics to determine the problem.
Are there any ST technicians around in California anymore?
Help me pleeeeeeez
atarikid@cox.net

What do you mean by "no memory"?

Without memory, the machine would not boot at all.

cu
Michael

Did you try my suggestion of searching on the Cortex web site for the driver? I don't know if it's still up, of course...

Cheers

Derryck

Hello,

I just found an old Atari 1024Ste with monitor. The monitor is at my=20

brothers house, the 1024STe at mine at the moment. But now I've got a fe=
w=20
problems..

1. I have no mouse. Is it possible to 'convert' a PC mouse to the it wor=
k=20
with the 1024STe?
2. There's a HDD port on it. Fun, but how can I get one on it.
3. What are the possibilities to connect the 1024Ste in a PC network?
4. There's a cartridge slot on the left of the 1024STE. IS this the old =

400/800/XL/XE slot?
5. No manual. Can it be downloaded somewhere?
6. No software. I wonder if there's some on the net (guess so, but=20
where?).=20

I hope someone can help me out.

I didn't see your suggestion before, but I tried it right now. They don't
have much on their site, so I dropped them an e-mail.
Now I have to wait for an answer.

Thanx for the tip.
  Zedd.

Hi Zedd,

>Ah, but my laptop (Dell) has a resolution of 1600x1200 on a 15.x inch TFT,
>and I love it. Linux runs great on it. Though running StEem in a window is
>a bit small when running a game in 320x200, but I can run a lot of them at
>the same time :-)

Heh, I bought a laptop to run emulation on too :) Mine isn't
quite a s good 1280*1024 but the Digital Ultra 2000 is supposed
to be very highly rated laptop. I picked it up as a repai job,
lots of problems on it. Almost fixed it though :)

>I also think it boots in Hi speed mode. It's a lot faster than my other
>ST4. This behavior can probably be changed with a jumper on AB
>or CD.

Find yourself Gembench, available on the web somewhere. I have
Gembench on CD, if you can't find it. Benchmark the computer,
and change some settings. I believe the Adspeed had 16MHz TOS
option, with TOS 2.06. I think it'll produce about 160%
increase, as it has cache.

Hi,

>What do you mean by "no memory"?
>
>Without memory, the machine would not boot at all.

That is true, if something appears on screen then it must have memory. Try something like Profile 2, or Sysinfo, to see what RAM you have. On my website there is some memory testers, under hardware section.

Thanks.

Here I am again, sorry to bother you all, but I've been using PC's far=20=

too long, and I want to get back to the old and noble Atari. I used to=20=

have the old 800XL and 65XE (the XL severely re-done to my own tastes), =

and now with the 'new' 1024STe I want to get thing back to were they=20=

were...

So here's the deal. The 'new' 1024STe I've found has (I presume though) =

only 1Mb of memory. After searching the web for the last 4 hours, I foun=
d=20
that the 1024STe can't get over 4Mb. Coincidence wants that I have 4x4Mb=
=20
(120ns EDO SIMM from an old 486DX80) lying around here. When I drop them=
=20
in the 1024STe, what will happen? Nothing, only 4Mb of (hopefully) 16Mb?=

>1. I have no mouse. Is it possible to 'convert' a PC mouse to the it work
>with the 1024STe?

Yes buts its probably easier to use a conversion board. I know
Mario Becroft does one at http://gem.win.co.nz/mb/atarihw/ but there
are others. Check out the group archives at groups.google.com

>2. There's a HDD port on it. Fun, but how can I get one on it.

Ah, its not a real HD port, more a stripped down SCSI port. You need an
adaptor
for it. Or you can get adaptors to allow standard IDE drives from keychange
www.keychange.co.uk
or Mario again (as above). If you get a laptop drive you can cram it inside
the STE. Very neat.

>3. What are the possibilities to connect the 1024Ste in a PC network?

Not much as far as I know. There is some TCP/IP stuff about so you can use
the
serial port to link it in, but the STe port is soem what limited by speed.
There is some descriptions of an adaptor at hardware.atari.org but as far as
know these are
currently "out of stock". Well at least I am waiting for Lyndon to tell me
he has more in...

>4. There's a cartridge slot on the left of the 1024STE. IS this the old
400/800/XL/XE slot?

No its an ST slot. It tends to be used for additional MIDI ports, dongles,
Digitizers
and of course the LAN adaptor mentioned above.

>5. No manual. Can it be downloaded somewhere?

I don't ever recall the manual being much use. Generally you stick a floppy
in,

(a blank 720K PC floppy will be fine - it speeds the boot process) and then just click away.
If you just want games replace blank disk with game disk....

>6. No software. I wonder if there's some on the net (guess so, but where?).

Lots, all over the place. Possibly www.atari.org would be good place to start.
Or the belgium FTP server. I don't have an address to hand. Again check the list archives.

>I hope someone can help me out.

Possibly, but you know what you want, there are lots of good search engines.
If you don't find what you want after looking hard then come back and ask...

If I remember properly you end up with a dead (I think only until you remove

them of course) STE. You certainl;y won't get 16 meg. The STE can only
address
16 meg (its a standard 68K cpu) and some of that is taken up with other
thinsg (rom, i/o)

If you want more than 4 megs then its a soldering iron job and some real
hacking.

Umm... unless it's different in .nl it's a 1040 STe, not 1024.

Atari used that trick to overstate its 16bit computer products and make them sound "better" than the lowly 1024 capable Amiga products.

You're correct, it only has 1024Kbytes of memory, whatever the model number might say.

Atari 16bit computers can ONLY address 4 Mbytes of memory.

This is a hardware limitation due to the number of address lines on the Memory Management Unit chip used in the system. There is NO EASY way to increase the RAM address space. (There were some hacks developed but they involved more than just plugging in a card.)

The 1040STe requires 30 pin SIMMs.   Parity or non-parity, non-EDO.

There are only 4 sockets, so you MUST install 1 Mbyte SIMMS.

4 Mbyte SIMMs will not work.

(Incidentally, there really aren't many software applications that require more than 4Megs of memory. You have to remember that software development for the ST computer line essentially stopped well over 10 years ago, and today's "PC mentality" of "More RAM, More RAM, More RAM" really doesn't apply.)

To answer some of your other questions- (let's see if I can remember them from your other message)

Mouse-   it's FAR better to find an actual ATARI ST mouse.   There ARE ways to use PC mice, but they are usually not all that successful.

The best kludge involves using a PC BUS MOUSE but those are hard to find.

You can use a PC SERIAL MOUSE but that requires loading a software driver and may not work with all software (games for instance that don't allow loading the driver before they take over the hardware).

Better to find an Atari ST mouse or clone mouse.

The "best" mouse I ever owned for my STs came from Best Electronics in

California, USA.   They're still in business as far as I know and may still have their mice available. Dunno their URL though.

Cartridge Slot- NO, it's not the same as the 8-bit slot.

There weren't all that many products released using the ST slot, mostly hardware enhancements, not many games or software.

There was a cartridge that allowed the ST to emulate a Macintosh computer, complete with formatting and reading actual Mac floppy discs. It was called the "Spectre GCR".

There were also a number of other Mac emulator cartridges, all of which actually contained the Mac system ROMs and worked pretty well.

Then there were disk copier cartridges which directly controlled the floppy drives to allow you to copy almost ANY copy-protected floppy disk.

There were others, you get the idea.

Network- NO

There's no easy way to put the STe on a PC network

The Atari computers were for the most part "closed systems", You got what you paid for, but had little or NO expansion abilities.

The "official" Atari company line was if you wanted more, you just threw away your current computer and bought a NEW one from them with the new capabilities you wanted... Of course that assumed that they would one day get around to releasing a computer that included those features.

Because of that, they did not make their computers easy to expand, and in a few cases actually took action to prevent users from doing it themselves. Only the last couple of "official" Atari computers had any kind of expansion abilities included, and those were almost useless in the "real world".

In other words, there's no easy way to add networking capabilities to the 1040STe.

I do think I remember hearing about someone working on an ethernet cartridge, probably from Germany, and probably VERY EXPENSIVE, if they ever finished it. (Many of the "kludges" that were developed to hack capababilities into the ST computers were produced in very limited numbers and were so expensive they were more intended for the "religious" few who would stop at nothing to expand their STs. Selling their car to pay for an ethernet cartridge would mean nothing to them.)

Hard Drive- This is fairly easy.

The hard drive port on the back of the STe will plug directly into an ATARI brand hard drive unit, or a third party hard drive unit intended for use on an ST. If you're lucky you can find people selling one of these online or on eBay.

The actual port is a "close cousin" to SCSI, but not SCSI. It's a somewhat "lite SCSI" implementation called ASCI.

You can buy adapter boards that will allow you to plug a standard SCSI hard drive into the ASCI port. You also have to provide a power supply and case to mount the hardware.

Then there is the driver software needed to operate a hard drive system. The "official" Atari drivers stopped development a long time ago, so they don't include support for modern very large hard drives. There are third-party drivers available which do address this.

However, just like memory, remember that EVERY ST program ever written would probably all fit on a 1/2 GB hard drive with lots of room to spare.

Manual- Not really needed. The Atari manuals weren't all that detailed anyway, and the system is very simple to operate. If you've used Windows, or better yet, a Mac, you already know how to do most of it.

Software- the Operating System is built-in on ROMs.

This means there are no "boot disks" needed. Just turn the system on and it boots, very quickly, to the desktop.

Then there are repositories of freeware and shareware software (and some "abandonware" commercial stuff) on the Internet.

You can download ST programs into a PC and use floppy disks to transfer the files to the ST. The two systems share an almost exactly identical disk format.

However, you must remember to format the floppy disks as 720K Double Density disks (and it's better to use genuine 720K floppies, not the common PC style 1.44Meg disks).

For compatibility it's better to format the blank floppies on the PC, and preferably from a true DOS command line.

Good luck!

BobR

>>accelerator.
>
>Hmm, never knew Titan made a Mega ST graphics board? Is it ISA
>adaptor, or custom chipset?

The Reflex graphics card was Titan's first product. I fitted one into an STFM (quite a lot of soldering involved!). I matched it with an A4 portrait monitor and it worked very well. Titan (Now Cortex Designs IIRC, if they're still around) used to have the driver available for download from their website. IIRC you have to specify a certain screen driver in nvdi.sys if you're using it (9?) for it to work. I sold this long ago.

>>I'm looking for the software/drivers needed to use these devices.
>

>Adspeed sold vey well, someone should have the drivers here.

Shouldn't need any software, isn't it controlled with a switch?

Cheers

Derryck

Hmm. Perhaps I've been in computers too long... Indeed, PC's (mostly=20=

Windows) have a huge hunger for RAM, so I figured that an ST would need =
```

some additional RAM as well. Okay, I think I'll drop the idea of=20
additional memory (for now...)=20

Yeah, right. I've seen a 2nd hand mouse in the UK... 20 Pound! For that =

amount I can order the convertor from the guy in New Sealand and have a =

PC mouse...

> The best kludge involves using a PC BUS MOUSE but those are hard to=

> find.

I used to have one for my (very old), but the connector card=20
malfunctioned and I couldn't use the mouse anymore, so I tossed it away =

(over 5 years ago)...

> You can use a PC SERIAL MOUSE but that requires loading a software
> driver and may not work with all software (games for instance that
> don't allow loading the driver before they take over the hardware).

I already got the driver for that trick. I think that this'll be the bes=
t=20
solution for the time being.

> The "best" mouse I ever owned for my STs came from Best Electronics in=

> California, USA.   They're still in business as far as I know and may=

I found them (www.best-electronics-ca.com). They're not too expensive fo=
r=20
new stuff, but I wonder how much shipping to Europe will be...

> Cartridge Slot- NO, it's not the same as the 8-bit slot.

I thought I've read that the ST would be possible to read the 8-bit=20
cartridges. Suppose I'm wrong right now (or I don't remember too=20
correctly anymore since I've last seen comments on the ST 10 years ago)=

> Network- NO

> There's no easy way to put the STe on a PC network

<snip Atari sales politics>

Hmm, the standard 540Mb limit (1024 cylinders) I suppose. I've seen a=20=

program for older PC's to get past that one, perhaps it is available for=
=20
the ST as well?=20
On the other hand, I still have an old Olivetti Quaderno (slightly=20
defective) with a 70Mb harddisk. Let's try to get that one inside the=20=

ST... ;-)

> Software-   the Operating System is built-in on ROMs.

> This means there are no "boot disks" needed. Just turn the system on=

> and it boots, very quickly, to the desktop.

> Then there are repositories of freeware and shareware software (and
> some "abandonware" commercial stuff) on the Internet.

Okay, let's search for that stuff! Anything to revive the Atari in my=20=

house again!

> You can download ST programs into a PC and use floppy disks to
> transfer the files to the ST. The two systems share an almost exactly=

> identical disk format.

> However, you must remember to format the floppy disks as 720K Double=

> Density disks (and it's better to use genuine 720K floppies, not the
> common PC style 1.44Meg disks).

> For compatibility it's better to format the blank floppies on the PC,=

> and preferably from a true DOS command line.

I've seen this suggestion as well. Too bad I don't have ant 720 disks=20=

anymore. Perhaps my father-in-law has a few of these oldies...

> Good luck!

Thanks, I'll need it... ;-) Perhaps I'll even need to buy some soldering=
=20
equipment... ;-)

There *are* plug-in cards: the Magnum ST (requires a socketed CPU) and the
Magnum STE are plug-in and require no soldering (except the DIL CPU socket
and one cable if the machine does not already have TOS 2.06 in case of the
ST, none on the STE).

>Because of that, they did not make their computers easy to expand, and

At least the MegaST, MegaSTE, TT and Falcon had expansion slots that could
be used for quite a range of additional hardware. The original ST was quite
"closed".

>RAM" really doesn't apply.)

Well, lots of sofware has come out since 1992... Most of the software I'm
running on a daily basis is definitly less than 5 years old.

But yes, 4 MB is really a lot of memory and will be all you need for most
programs. But as soon as you begin to run several programs in parallel,
using RAM-disks (essential on a one floppy only computer) you end up
using it all.

>The best kludge involves using a PC BUS MOUSE but those are hard to
>find.

I had a feeling they have become more popular again. I've got a bus mouse
with extra buttons for scrolling etc last year for my pc.

>There weren't all that many products released using the ST slot,
>mostly hardware enhancements, not many games or software.

>There were others, you get the idea.

Not to forget all various dongles for Cubase, Notator, Masterscore, etc
incl extra functions for sync, midi etc.

Also video digitizers and CD ROM drives and lately Ethernet network uses the cartridge port.

>Network- NO
>
>There's no easy way to put the STe on a PC network

Actually I would answer yes! Remember that Atari systems use very little RAM. A 19200 bps nullmodem tcp/ip link _is_ usefull to transfer files to and from a pc. Remember when 2400 bps was the standard??

I have not tried it myself but a ST should be fairly easy to speed up the serial port to 38400 bps by some simple harware mod. This equals a 28800 modem that lots of people found very quick 5 years ago.

>I do think I remember hearing about someone working on an ethernet
>cartridge, probably from Germany, and probably VERY EXPENSIVE, if they

Yes and he sold a lot of them for a fair price. I paid something like US$ 65 inkluding everything 1 1/2 years ago. Unfortunately he can't sell any more as the Genius Pocket Adaptor is out of production.

>However, just like memory, remember that EVERY ST program ever written

Hm, I have a 1 GB drive full off stuff here...

The ST does not know anything about "cylinders", only logical block numbers. The only problem is that ACSI can only use 21 bit block numbers, limiting disc size to 1GB when using a standard ACSI-SCSI host adapter with an old driver.

This can be overcome with some combinations ACSI host adapters and newer drivers.

Yeah, right. I've seen a 2nd hand mouse in the UK... 20 Pound! For that amount I can order the convertor from the guy in New Sealand and have a PC mouse...

That's secondhand refurbished if you're talking about Keychange and that includes UK Special Delivery postage.

Yes, you can order the convertor from NZ.

Don't forget to add postage and currency charges, as discussed here recently.

Then post to let us know the total>

I am trying real hard, and there are parts coming in this week,
so hopefully I can start to get some moving. I'm tied up in
exams at the moment, thus sometimes it has been a strain to fit
everything in.

I got a response from Cortex. With v2.0 of the drivers included. I just
tried them. And it works GREAT. I'm running in 1024x960 on a SM146. It also
supports things like hardware zoom and virtual desktop.

It's a very nice card. I wish I had it 10 years ago....

Now I'll connect my TTM194 (TT-hires) to see what I can get out of that
one.

Thanks to you all for helping me out here!

Greetings,
  Zedd.

Yes, the pinout of falcon and ste is the same for the genlock"st"
this is the pineout between genlock din13 and falcon motherboard.
Maybe this can help you? left ste din 13, right falcon db19.

synchro from genlock.
(without video pal, this mode work)
>
> Do both of these connect to the genlock?

i haven't all the technical detail for this point.
But you need a prg "tsr" gem prg to initialisation
of the genlock ;

few detail i find.
resolution 625 lines
the computer is lock from video pal so genlock out use.....black burst from
video internal pal clock.
or from internal genlock clock: 32 mhz if there is no video-in;
the possibility:
direct keying: the black background of the atari picture is tranparent for
the video signal.
inverted keying:the black background of the atari is use as programmable
mask for the video picture.

3 positions:
dir overlay, you can select between black &gray level.....
key: video only
inv:inverted key

```

>
> Is this illustration correct?
```

i don't understand your plan?

the result normaly : you can use normaly your computer monitor.
The other result, you can see the final result on video monitor or television.

> What I'm not sure about is the "clock enable" and "external clock" pins,
> but as far as I know, these are the two genlock relevant pins on the
> STe's monitor connector.

Yes you find the correct pin.
I find the same information as you:

So normally all the gst model for Amiga and model"st" from
"satellite television"model ST pal, st Y-C;should work in europe.
It still exist N.T.S.C model too.
last time, i give you a link usefull, for "a multimedia product"
this genlock support directly "vga", svga, xvga, so compatible with
falcon....

>
> The reason I'm asking all of these questions is because I want to make

> genlock instead of only Atari specific ones.

well, you can try to build patch with coaxial 75 ohms with BNC connector
R+G+B+synchro, you can find this in connectic computer shop .....
just like big station SGI monitor.

Has someone already tried to modify CT2 flash-memory? (If only to
change the boot-screen's wonderful colors ;-P...)

As I understand the CHPB (CT2 HARDWARE PROGRAMMING
BOOK), to modify flash-memory one only needs:
- writing any byte value to $F6140000 for instance (*) (unlocks
flash-writing)
- writing new flash data to $F400xxxx (64k flash memory image)
- writing any byte value to $F6100000 for instance (locks

flash-writing)

...is that correct??? Else if someone knows the flash image file format used by Centek, please let me know...

In fact (before doing something silly) I would like to know if there was a way to restore flash memory easily in case the modified flash code had a bug: some sort of AUTO_NVM.PRG for the flash memory...

Another question: does someone know the meaning of the value stored in the _CT2 cookie?

My goal here is to stop PMMU from doing address translation from $04xxxxxx to $01xxxxxx. (I think few *modern* programs would suffer from that, and I would be useful for a project of mine...) Memory mapping should be the only difference between TOS 4.0x and the so-called TOS 7.0x, right?

(*): BTW what use is address-bit 23 here???

part
| > of the world are you in?.

Tunbridge Wells, is that still there, I though they dug that up to make a
ramp to the M25. 8-)

Seriously, you really aren't that far away, a short drive to the M25 would
get you there in another 20 mins at this time of the day. Without knowing
exactly where you are in T.W., I'd expect to take the M20 to the M25.

The next meeting is on the 24th April, a Wednesday (as always). Check
Derryck Croker's home page and click the C.C.C. link to get a map, or just
click here http://www.cix.co.uk/~derryck

As you'll be a new member you're expected to bring offerings of free food
for the fat welshgit.

Hey Paul, Wayne from Dalton, GA. here. I had no idea that could be done! As I read your post, I looked down at the Mini MacMan I have laying around unused. I'm gonna try that, and I'll let you know if it works for me!

I've heard good things about the MO-4, also steinburg made something called SMPII, or something like that.

How are you likeing Audio Tracker?

Wayne

A LAN cable, one should have come with the Mini Macman.

An store that sells Apple products should have'em.

Sim to a ADB cable.

Sounds good. Does it come with a special Cubase Audio/MROS driver?

Great. I am in California (USA) though. What are we talking about as
far as the cost of the interface and shipping?

By the way, you can contact me through e-mail about this:

I've been following the uClinux mailing list for
while and would love to crack on with setting up
an Atari port but for time :-(

One of my stumbling blocks was understanding which
gnu suite would be best to build the thing? m68k-elf
appears to be the favourite, except this would require
a linker configuration for the ST. Also would gcc require
some Atari specific headers/libraries for this project, or
do the ones for a Linux kernel suffice as this is a new OS?
I guess that the m68k-atari-mint suite is not suited to this
work either?

Paul Coene's port used a mixture of a gcc linux build for
making the kernel and a coff build for user apps. Has this
all been superceded by the elf flavour? Are there advantages/
disadvantages to both coff and elf that makes one a better
choice for a more lowly 8Mhz Non-MMU 68000?

Finally, I'd hazard a guess that the 2.0.38 kernel would
be a better goal as the 2.4.x stuff is more demanding
and the source is slightly less stable?

Regards,

Mark

Cool! It definitely works, but I think the driver is conflicting with something in my system, which is causing Cubase to crash randomly with the Mini MacMan connected when recording MIDI data. I've run a completely 'clean' system too. Maybe it doesn't get along with the Nemesis (whether it's ON or OFF)?

I'd be curious to see how it works out for you though.

>How are you likeing Audio Tracker?

So far, it's very nice. I'm still getting comfortable with it, but it seems to handle multiple audio tracks much more quickly than CAF - although it needs to take over an entire partition to create it's own special "tape" format on the drive. I don't mind because I have a drive with several empty partitions that I use for recording anyway.

And this "tape" format allows for faster recording and playback in the end. Plus you can export everything as .WAV or .AIF files when you're done anyway. And, the interface is nice too, and it works well in color, with professional and modern looking 3D dialogs.

It has a lot of sound file editing features as well, although I haven't gotten into that part of the software yet. And it can import Cubase Audio arrangements if need be.

Overall, some things about it and the way it handles audio tracks are similar to Cubase Audio, but other things, in my opinion, are better. One thing about Cubase Audio that always seemed a little overly complicated was the whole distinction between "parts", "events", "segments", "lanes", "channels", etc. It just seemed unnecessarily convoluted and inefficient to my brain. That's something they've changed and made a lot better in Cubase VST from what I understand.

I would have to say that Audio Tracker was worth the money (it was only around 65 US dollars). By the way, I ordered it directly from SoundPool - they simply e-mailed it and the manual to me.

Batteries are available from Radio Shack. search on their web site
www.radioshack.com for part number 960-0012. It is Tadiran TL 5242W
clock battery 3.6v 1900mah $12.99 it has the correct connector and
velcro strip. I got one for my TT several months back.

Your Mini MacMan didn't come with a cable?

I guess it's just a standard "Apple MAC serial cable", although it might be considered an "AppleTalk" cable? I bought the interface used from a guy a long time ago, and the cable came with it, so I never had to go looking for one. I would think any computer or electronics store that deals with MACs could help you out. Just take the interface with you and look for a cable that fits. It's the same on both ends (8 pins/male connection) with one of the pins slightly offset from the others.

Checking the MIDIman web site, it says it's a MAC serial port connection. Go here:
http://www.midiman.com/products/midiman/minimacm.php

Keep in mind that you also need the MROS driver. If you e-mail me, I can send that to you:

The kernel does not need to be buuilt as a TOS executable, so using a m68k-elf toolchain should work if you load the kernel by some other means (eg. a separate bootsector or auto program).

>some Atari specific headers/libraries for this project, or
>do the ones for a Linux kernel suffice as this is a new OS?

It might work - ask Frank Naumann if there are differences in calling convention.
You might have to use a different linker (ie. m68k-elf), depending on what you are up to.

```

hi! i confirm, i don't understand!
>
> What don't you understand? I've tried to draw it as clearly as possible.

I understand you mix 3 diff�rents things?

1) genlock it is video master to mix with picture computer.
On the out video, it is always vcr or video monitor.
The dvd player is a player, so it is in for genlock!
2) On atari, ste or falcon, it is support for only low, medium resolution.
(15 mhz frequency) it is the point for R.G.B.
3)The compatible atari genlock need special soft too to operate
with good plug.
>
> The above is basically what I want to know. That, and if there is a
> standard genlock connector so I can add such a connector to my STe.

Not standard, "with brodcast television in Paris we use "black-burst 75%.

(for overlay)
the standard connectic you can find on "multisynchro monitor" is
RGB+synchro
�the standard atari can be find with din13 on "st genlock".
Another possibility for mega ste, is the chili card on vme bus.
This card design for atari, have internal genlock+2 dsp.....

Yes, i give you the right solution.
coaxial R.G.B, : ground+1 diff�rent color for each.
one synchro coaxial 75 olm impedance for synchro.
all with bnc connectic.
It still exist very thin coaxial c�ble with the right 75 olms.

If, you want to reply me on my mail:
just remove no spam.
persojpg@nospamm6net.fr
It will be a pleasure to help you to find the best "elegante"solution
with you......
I can give you details, and maybe link you haven't :-)

So if i can help you more don't hesitate.

bye!

Thanks Paul & Richard! Yes, the Mini MacMan came with a cable. I guess I need to take another look at the Falcon. I didn't remember the LAN port looking like the MiniDIN. Yes Paul, I'd like the MROS Driver, I'll email ya. I've gotten the Mastering stuff from soundpool. For $69.00ish, I guess I'll have to try Audio Tracker!

I'll let you know how the Mini MacMan works out for me. I'll be trying it first on my CT2B Falcon, which, by the way, has been running great since I sent the MB to Rudolphe in France to fix my bad installation. If it works there, I'll try it on my Nemisis Falcon to see what happens. My Nemisis Falcon is destined for a CT60, when it gets here. I hope I won't have to remove the Nemisis for everything to work properly. I'll also probably be recasing that Falcon into another case.

(I'm not sure here)

I don't think the flash is used in "standard" mode, but it can still be accessed by the Flash utility.

> My goal here is to stop PMMU from doing address translation from

Ah. Have you upgraded the lattice code? (I've been meaning to do this for while, but I haven't had time to experiment with it)

Perhaps there is a workaround. Boot in TOS4, and make a patchprogram for the autofolder?

/Peter

Yes it is still here, the ramp goes over the top - you get used to it quickly.

> Seriously, you really aren't that far away, a short drive to the M25 would
> get you there in another 20 mins at this time of the day. Without knowing
> exactly where you are in T.W., I'd expect to take the M20 to the M25.

It is about an hour and 15 minutes, my sister is not far form there.

I was looking for a reason to take the car for a spin, need to find out how fast it will go. Maybe I will turn up, any entrance fee?

Elliot...

[Assuming 'standard' mode means 'CT2 card deactivated': (it is what
you meant?)]
Well then if this is correct my problem is solved. Thanks! Will test
that before attempting anything anyway...

> > My goal here is to stop PMMU from doing address translation from

You mean upgrading to revision AN or BN (where this problem gets
solved by hardware)? I did not know this upgrade has ever been
available! But if it is will certainly upgrade!

> Perhaps there is a workaround. Boot in TOS4, and make a patchprogram for the
> autofolder?

Well if the memory-mapping is the only difference, perhaps some sort
of FASTRAM.PRG to declare how much Fast-RAM is available (and where)
could do the trick!

I will keep you informed of my "discoveries"...

Cheers,
Guillaume

hi!

I hnow it is very difficult to forget computer.

But genlock are design for special effect video.
IT is one tool for incrustation of pictures for video.

Another difficult point is the fact that video is realtime
25 i/s and with only fix computer picture.

So, the wedding between the two industry&technologie isn't easy.
the result is :this is new concept for "computer specialist".

So, if you accept this idea, the thing is easy.

For a good visualisation of your future implementation
i give you the link for bnc: standard traditional for video.

http://www.national-tech.com/catalog/rg58bncconnectors.htm

nota bene: i use genlock with my atari for several year now

> > If, you want to reply me on my mail:

Your first visit is free.

Thereafter it's �3 on the door every month.

Grab the map from the CCC page on my web site or use one of the online
mapping sites to look up "Windmill Lane, Cheshunt".

Cheers

Hi,

We launch an exciting project : our aim is to build a new, original, coherent
and fun computer. Of course, it will not be a "PC Killer".
The ML is opened to everybody and volunteers interrested to discuss about this
new computer concepts. It could be coolif you help us to have a Atari ST Touch...

The ML to discuss abut it : www.egroups.com/group/project-hardware

Have a nice day,

Chris

Is there anyone out there that has Pro BASIC 3.0? My originals went bad after all this time. I blame data rot.

If somebody knows a place where I can download it, or if anyone has it as an image file that I can make new disks with, I'd appreciate that.

Thanks in advance,

-Don H.

The original built-in 60-MB 2,5" IDE-HD in my Falcon is dieing slowly,
so i want to replace it with an bigger actual drive.
But which actual drives run proper in the Atari Falcon?
Is the Falcon capable of working with an actual 20 GB-Drive? (lesser
capacaties are hardly found)
Other solutions like external SCSI-Drives are not an option for me.
Which Hard-Disc-Driver should be used? How to partition that?

Greetings, Chris.

Hi Elliot

| > Tunbridge Wells, is that still there, I though they dug that up to make
a
| > ramp to the M25. 8-)
|
| Yes it is still here, the ramp goes over the top - you get used to it
| quickly.

Ah!, so when i go over the top and spit, thats where it lands, and i thought
it was the grass that made it green!!.

| > Seriously, you really aren't that far away, a short drive to the M25
would
| > get you there in another 20 mins at this time of the day. Without
knowing
| > exactly where you are in T.W., I'd expect to take the M20 to the M25.
|
| It is about an hour and 15 minutes, my sister is not far form there.

Sisters?, hm!, "Females", tell me more?.

| I was looking for a reason to take the car for a spin, need to find out
how
| fast it will go.

Same here, i run out of road at about 140Mph so aint managed to max out yet.

| Maybe I will turn up, any entrance fee?

First meet is free, you'l need to feed the fat welshgit as youre the newbie,
its a rule, Derryck, the membership secretary will try to convince you
otherwise though!.

> Is the Falcon capable of working with an actual 20 GB-Drive? (lesser

Yes. Watch for ATA3 compatibility. Use HDDriver for that devices.
Connect it, load HDDriver, make your partitions, save driver on c: on
disk, restart and use it ;)

i ried to save the desktop on a 1040 to loppy, but when i clicked on
the save desktop option the computer activated the disk drive for about
a second or two, then the 1040 came back at me with "this application
can't find the folder or file yuo just tried to access"
also when i format a floppy in double density it formats it, and says
that i have 907915624 bytes. a little high right.
any idea's?,
thanks,
lance

Hi,

> You mean upgrading to revision AN or BN (where this problem gets
> solved by hardware)? I did not know this upgrade has ever been
> available! But if it is will certainly upgrade!

Yes and no. The code is available from Mr. Czuba, but the current code in the flash does not support the new fastram address.

Strange experience (No drugs involved) :
Perhaps TOS4 allready supports fastram at $01xxxxxx? One day, my machine crashed, and I rebooted in TOS4 mode. After testing my ST-RAM, for some reason, it started to test my TT-RAM (!). Ofcourse, it crashed, and locked the machine. But perhaps this is not the case with the new fastram address?

> Well if the memory-mapping is the only difference, perhaps some sort
> of FASTRAM.PRG to declare how much Fast-RAM is available (and where)
> could do the trick!
> I will keep you informed of my "discoveries"...

Great!

Regards

/Peter

Which height may the drive have? 12.5mm or 9.5? Or do both fine? I
think i will buy the IBM DSOA-21080, but it has 12.5 mm height (only
44 EUR new drive at alternate.de, but offers only 1 GB, but way enough
for all my old stuff :-).

```
Where to get the latest HDDriver? Is it free for download? I'm a
little bit out of date in terms of Atari.

> Which height may the drive have? 12.5mm or 9.5? Or do both fine? I

Both modells can be used on falcon. Newer hard disks als need new screw
holes on hard disk tray. Only older models from list use the same screw
holes.

> think i will buy the IBM DSOA-21080, but it has 12.5 mm height (only
> 44 EUR new drive at alternate.de, but offers only 1 GB, but way enough
> for all my old stuff :-).

Yes, that�s ok for an falcon. Used here an 2GB toshiba drive.
Enough space for all the collected stuff :)

> Where to get the latest HDDriver? Is it free for download? I'm a

HDDrive isn�t free.
http://www.seimet.de/atari_english.html
Use the demo release to test your drive.

HDDriver is the best choice, it is supported.
AHDI is free, old, slow and without any support.

Regards, Robert

It's no problem using a 20 GB drive. Note, however, that TOS limits the maximum partition size to 1 GB. With MagiC or MINT you can have larger partitions.
The only driver supporting IDE drives larger than 8 GB is HDDRIVER, http://www.seimet.de/hddriver_english.html.

No, it's commercial. You can order it with a German manual from me or
with an English manual from Atari Workshop in the UK. Please refer to
http://www.seimet.de/hddriver_english.html for details.

Hello Lance,

I had that happen to me a few times on my STe. If I remember correctly,
I just turned off the computer and did it again. I also remember
reformating the disk again. You can try another disk formating program.
There are many. Also try another disk. All worked for me at one time or
another.

>Is the Falcon capable of working with an actual 20 GB-Drive? (lesser
>capacaties are hardly found)

I take it by 'actual' you mean 'current' or 'up-to-date'.

20 GB might be a little too much for TOS or MagiC, as TOS 4.xx can only address partitions up to 1 GB in size. You /could/ have 20 of these, although some file selectors will not show them as they only cover devices A: to P: Also, with MagiC (and perhaps also MiNT), U: is reserved for the system and it is usual to use Z: for a CD-ROM, so there are just about enough letters available!

Note that you don't have to use 2.5" drives - you can use 3.5" which are generally much cheaper. I put an IBM DTTA-350640 3.5" drive in mine. There is just enough room, but you need an adapter for connection, available from Mario Becroft in New Zealand or Abingdon Synthesis Projects in England - contact address is chris.crosskey@metrics.co.uk. You also have to solder 4 wires to the power supply, which is a normal HD 4-way cable and not part of the main ribbon lead that is used for 2.5" drives.

>Which Hard-Disc-Driver should be used? How to partition that?

HDDRIVER is far the best one going. You can download a demo from Uwe Seimet's website http://www.seimet.de and he sells german versions. If you want it with an English manual (by yours truly), then try Atari Workshop (mail el@atari-workshop.co.uk).

Regards, /Peter/

quoting:

It tests the expansion interface, in part by software, and the remainder by LEDs. The data and address busses and interrupt lines are tested in software. The control lines from the CPU are tested with the LEDs. Most of the LEDs will go off after the system is turned on and the menu appears on the screen. Three LEDs will remain lit: BR (bus request), BG (bus grant), and BGAC (bus grant acknowledge). These should go off after (1) the expansion connector test is run, and (2) either the DMA test or floppy test is run.

<skip>

--these seem to be LED ids--

Initialization (errors occurring before the title and menu appear)

I1 RAM data line is stuck
I2 RAM disturbance. location is altered by a write to another location.
I3 RAM addressing. Wrong location is being addressed
I4 MMU Error. No DTACK after RAM access.
I5 RAM sizing error. Uppermost address fails.

Excetions (can happen at any time.)

E1-E5 not used.
E6 Autovector error. IPLO is grounded or 68000 is bad
E7 Spurious interrupt. Bus error during exception processing. Device interrupted, but did not provide interrupt vector.
E8 internal exception, from 68000
E9 bad instruction fetch
EA address error, tried to read or write a odd address
EB buss error. device not responding

RAM

RO error in low memory
R1 Error in RAM chip
R2 address error. bad RAM chip or memory controller
R3 Address error at 64K boundary
R4 error during video ram test.

That was more than I wanted to type, but that covers LEDs and all the errors that a dead machine might have. I assume that you have the necessary diagnostic cartridge, and a serial link to a VT52 terminal, such as a working ST running vt52. If not, you need them.

Jim,

Thanks for the information. I do have the diagnostic cartridge (3.5 and 4.3) , loop back board and the expansion port fixture. I connected the unit to a vt52 terminal and nothin. So I check it out with a working ST and it worked great as usual. I guess Ill keep messing with it. Hopefully it doesnt get the hammer soon!

Thanks again,

Don

I have had my old atari STE sitting a box for years and its time to get it up and running again, I miss turrican...8-)
But I want to start using a hdd instead of floppies, or maybe use a networked drive off a PC(is it possible?)

Can anyone point me in the right direction to find a link 97 to suit an atari ste.
does the link 97 have a asci pass thru so I can use my old slm laser printer as well?..

will possibly trade atari slm laser printer for a link 97 and software

I am in Australia, wher there is very little atari gear(and no shops)

ther best price I have seen is
Link 97 Hostadapter HDDriver
ATAHARD0010
159,00 at http://www.woller.com/

I will be in Germany for the Octoberfest, so that might be an oportune time to pick up some atari gear...any recomemndation for a place to buy a lin97?

I found that I had to completely insulate the drive from the tray in my
Falcon with insulation tape on the tray, nylon screws and a couple of
plastic spacers under the tray's mounting feet.

Cheers

Yes, and MiNT net is one solution. There are others, and if you wish to
use the PC drive as an extension of the ST, there is one for that. It is
on the Umich archive, I think, old but good.

: Can anyone point me in the right direction to find a link 97 to suit an atari
: ste.
: does the link 97 have a asci pass thru so I can use my old slm laser printer as
: well?..

No, but the SLMC804 adapter has a pass-through for a Link97.

: will possibly trade atari slm laser printer for a link 97 and software

I would not do that. It is a good printer.

I assume that price is in Euros, and amounts to about 80 Euros each, which
is not a bad price.

Huh? How did you know it was TT-RAM that was being tested? Did it show
a progress especially for TT-RAM or test more than 14MB?

> the machine. But perhaps this is not the case with the new fastram address?

If I have some time this week I will try writing a simple FASTRAM.PRG
program...

Well at least we have a river now.

> Sisters?, hm!, "Females", tell me more?.

Girls are great, they can do all kinds of things that (most) men would not dream of doing. However I would have to think of some really inspired excuse to get any to come along to one of these meetings. Any ideas that does not included computers or fat (welsh) men? I do not think either are appealing to them let along together.

> Same here, i run out of road at about 140Mph so aint managed to max out
yet.

I got 140 too the other day but ran out of bottle, I only had one barely legal tire at the time so...... anyway got some new ones now.

Rack of lamb maybe! Actually I think I may stick with Derryck's rules.

I will have to see if I am working early on Thursday.

Elliot...

Not to run progs from, but you can store and retrieve data from a PC.

>does the link 97 have a asci pass thru so I can use my old slm laser printer as
>well?..

I think that the controller box for your laser has a pass-through, but it's been
a long time since I've had one of these.

The ACSI adaptor itself won't have one.

Cheers

damn...I guess its defintely the hdd then, would be cool if you could run
program staright from web pages...the ste is no longer virus/trojan material

>I think that the controller box for your laser has a pass-through, but it's been
>a long time since I've had one of these.
>The ACSI adaptor itself won't have one.

yes you are right, I just checked it has two connetcors on the slm controller
defintely link 97 time,  I just have to find some who is willing to send to
Australia..

Why not use a PC Style IDE disk. I think Mario Bencroft does an adaptor
and if you get a laptop 3.5 inch drive you can just about sqaush it all in
the ST case.

Hi,

> Huh? How did you know it was TT-RAM that was being tested? Did it show
> a progress especially for TT-RAM or test more than 14MB?

I think it was for TT-RAM. The machine displayed a second progress bar, for another ram type, and I think it said "TT-RAM", but it could have said something like "Alternate RAM" too, I don't remember exactly as it is over a year ago.

I think the progress bar used the character 'X'. And yes, I know that this sounds like bull, but it happened. I have never been able to reproduce it no matter how much I try.

/Peter

Huh? what port are you talking about?

I am quite sure my Mega *has* power on the cartridge port. Or did you mean
the internal port on the Mega? That one has power, too - it is an extra
connector, with both +12V and +5V.

So, surely you'd like to get some money back from those boards?
How about selling them, are they working? I assume you need to
solder them up and program chips etc.

http://eiffel.atari.org was just updated about a new firmware Beta version 1.0.3, some usefull documentations about IKBD, PIC and some commercials IC from HOLTEK.

a small TOS example program eiffelcf.tos show how to program Eiffel Flash Datas and change mouse scan-code to use the wheel under any OS, and change map HELP/UNDO onto Print Screen/Scroll.

Best Regards
Laurent

Hi Michael,

>Right. However, without a closer look at the datasheet, we still don't know
>what kind of bus cycles the 68030 uses on a read access on the cartridge
>port: if it does in fact do a 16-bit read, even if only 8 bits are needed,
>then even a modified GAL can't generate "correct" UDS/LDS signals from that.

I had it wrong, the Combel made ROM signals, and the GAL made
UDS/LDS. I guess this is the part to emulate the 68000, or so
to speak. I don't know if you say my last post about
disassembling the GAL but it pulls LDS/UDS low on all read
cycles, no matter what size or offset of data. I think by
removing the RW line into the GAL, and tieing it to ground may
fix it. However, I haven't looked into the other areas of this
GAL, they may require the RW line too. Still, there is not much
I can do about it, and face the fact that it has to have written
data shifted up to A1 to A8 for an 8 bit write.

wasn't your last comment 'HOBBY'

> but lots of bad about some companies that fitted them.

So you must be talking about me then, as I was the only
person who fitted them. If you have anything to say then
lets hear it in public to the group instead of your insipid
comments that only make you look foolish. The main
reason I left the Atari scene was because of people like
you.
I for one am fed up of your comments so if you have
a complaint about Veloce or it's 'FITTERS' then lets hear it
otherwise apologise to the group for your fictitious postings.

> Its got a 68020 hasnt it?.

Certainly has. Full 32Bit 0 wait state TT RAM.

Hi Dave,

I see you still have a face like a smacked arse., howz things ooop narth,
are the sheep still worried, still signing the register?.

| > Hi Hallvard
| >

| > | I'm interested in looked into hardware accelerators for my STe and
have
| > | read the specs for TUS' Veloce+ with great interest.
| > | Anyone using it? Any other accelerators worth looking into.
| >
| > Ive only heard good about the Veloce board,
|
| wasn't your last comment 'HOBBY'

I read about the Hobbit once, but no, my last comment was as above, see, the
last comment!. Ah!, your trying to ridicule me arent you, missed me!!.

| > but lots of bad about some companies that fitted them.
|
| So you must be talking about me then, as I was the only person who fitted
them.

No you werent.

| If you have anything to say then lets hear it in public to the group
instead of your insipid
| comments that only make you look foolish.

I am speaking in an open group bollock brain, isnt that where you saw it?.

| The main reason I left the Atari scene was because of people like you.

Elsewhere you stated that you still answer the phone, i quote.

>" Send email to maccdave@ntlworld.com or ring the old number in the
>magazine. CLOSED DOWN ? nobody told me and iv'e been
>answering the phones all these years."

SO it seems youve not left the Atari scene, that Gin seems to have left its
mark. Must do some cleaning!.

| I for one am fed up of your comments so if you have
| a complaint about Veloce or it's 'FITTERS' then lets hear it
| otherwise apologise to the group for your fictitious postings.

Look bollock brain, where did you see me complain about the Veloce, i gave
you a plug, i'd send you my address for the commision cheque only you
already have it, i only stated ive heard bad tales about some of its fitters
& fettlers, no rumours, no fiction, just public facts, so factual in fact
that Ann Robinson could probably tell you a tale or two.

| > Its got a 68020 hasnt it?.
|
| Certainly has. Full 32Bit 0 wait state TT RAM.

An achievement you should be proud of.

Bye for now, say hello to ???? <oops, stop it>!!.

Old information I'vbe got says it's a 1AA/C Lithium 3.7V 1.9Ah
battery, available from RS Components in the UK.

Alternatively you can buy a tested one from Atari Workshop. Fitting is
trivial.

AFAIR, there are two types of TT boards: one needs a 3.6V lithium battery,
the other needs a 6V battery.

Both should be easy to replace (if you are in a hurry, use 2-4 alkaline
batteries), but you should make sure to get the right voltage.

But how do I know which one to use in a TT where the original is already taken out by someone else?

I have two TT's here of the older type with metal shielding and both has 6V batteries. I got a messages from someone who has a metal shielded TT that uses a 3.6V battery, so it looks like they changed this _before_ the introduction of brown paint for shielding?

Are there different types of RT clocks or what?

Hi Hallvard

| I still don't understand the principle and general use of a genlock. So
| far I understand that it's a device which synchronizes two video
| sources, making seamless mixing possible.

Thats the idea, its intended that as all devices are locked to the same master sync generator, then when the souce signal is switched the outgoing frame is still syncronised. You probably remember back in the days of monochrome television that any outside broadcast switch in's resulted in a rolling picture.

Worse still, in nearer times, some televisions exploded when the line oscillator re-synced mid line.

Thanks everyone for your answers! I'll pop the case on the weekend and see what I can find, and at least be able to use a jury-rig battery if I can't easily get a replacement. Hopefully it'll be back to remembering the date and time soon!

- Ross.

wasn't your last comment 'HOBBY'

> but lots of bad about some companies that fitted them.

So you must be talking about me then, as I was the only
person who fitted them. If you have anything to say then
lets hear it in public to the group instead of your insipid
comments that only make you look foolish. The main
reason I left the Atari scene was because of people like
you.
I for one am fed up of your comments so if you have
a complaint about Veloce or it's 'FITTERS' then lets hear it
otherwise apologise to the group for your fictitious postings.

> Its got a 68020 hasnt it?.

Certainly has. Full 32Bit 0 wait state TT RAM.

Hi

I would like to get linux running on my atariST..
Will I be neading any extra`s to boot linux on it?
BTW I also have a magefile 30?
I would like to see it boot before adding any Alian hardware on it..
If it works I might be willing to add some Alian hardware on to one of my ST`s.

TIA

That's fine if you're just replacing or checking the batteries. If you
buy a battery from Atari Workshop, it comes with a lead that plugs in
under the skirt around the right hand edge of the drive bay.

Full Linux/68k requires a 68030 (or maybe a 68020 + 68851 PMMU).

On a 68000, you might get uCLinux running.

Oops they stop this kind of activity.
For now, they sold "satellite decoder"

    I find another link for you.
    It is another "compatible hardware"
    500 euros, it is a minimum price for correct quality.
http://www.spc-international.com/html/vinegen_ii.html
    Maybe on ebay too, you can find good genlock:-)
    Just respect specific technical signal.
    On atari we have already rgb and genlock support, so.....

    If, you decide to use "atari with a genlock"
just tell, maybe i can give you plan, "tips&tricks".....
bye

I lifted the hard drive lid on my TT (it's one of the original in Canada, from U.S.) there's a metal shield taped down covering a circuit board. I removed the tape and no battery there. There is a metal shield at the back, angling up, which is where I understand the battery to be. My understanding is I'm going to have to take the whole cover off to get at it (I have done it a long time ago and remember twisted metal tabs hold it down. Does anyone know differently?

Thanks - Ross.

So you must be talking about me then, as I was the only

person who fitted them. If you have anything to say then
lets hear it in public to the group instead of your insipid
comments that only make you look foolish. The main
reason I left the Atari scene was because of people like
you.
I for one am fed up of your comments so if you have
a complaint about Veloce or it's 'FITTERS' then lets hear it
otherwise apologise to the group for your fictitious postings.

> Its got a 68020 hasnt it?.

Certainly has. Full 32Bit 0 wait state TT RAM.

Dave

Greetings,

Today I started up a TT030, and instead of the familiar Atari logo, all
that I get are some broken blue vertical lines. Can anyone suggest a
course of action? I don't have an Atari TT030 diagnostic cartridge.

Thanks,

John Perez

If it got that far in booting, my guess is the TOS roms are either dead, or they need a little reseating. That general pattern is what you get when a diagnostic cartridge is testing memory, and displaying it on the screen. That is what makes me thing that TOS is broken, or redirecting the screen memory to some other place. Start by observing static elimination rules, and have a go at reseating those chips.

Not on a ST - there is general 68k support:
http://www.uclinux.org/

It looks like there was a ST port, which was discontinued:
http://www.esat.kuleuven.ac.be/~pcoene/atari.html

I never tried it - my embedded Linux work has been on PowerPC and Hitachi SuperH CPUs, and since these have a MMU, I used the "real" Linux.

Hmm, sounds bad. Perhaps bad PSU? Has it not been used for
long time? Perhaps the Shifter? Have you tried hitting reset a
few times?

Thanks for the advice guys...

It does seem that it is getting into the boot process so perhaps there is some home. I have tried hitting reset a few times, also re-seating the existing Roms and PLCCs. I have 3 1/2 TT systems here, so I'll swap out the ROMS and PSU to see what happens.

Aloha!

> and how to set it all up.

I'm no expert on genlocks but I saw a schematic of an Amiga genlock some
years back.
If I understood it correctly it worked like this:
The genlock strips the sync from the external video feeds it to a phase
comparator, the comparators output
was fed to a low-pass filter wich in turn controlled a VCO, the VCO-output
is divided and also fed to the
comparator, thus making a 'phase locked loop', how many times the VCO
frequency is divided determines
the frequency. So basically they had made a 'master clock' just feed it to
the clock input and the amiga
would sync itself to the external video.
The amiga (and probably the STE) have a signal (/PIXSW?) that changes when
color #0 is displayed and
that is used to control what video is shown and when.

Or something like that...

Greetings,

Well, I swapped out the PSU and Roms, with no change. I'm not sure which IC is the shifter, or whether it is socketed on this board. This particular one doesn't have too many sockets. This really blows, since out of the 4 TT boards that I have, this is one of the two that would run Emagic Logic (thanks to the copy protection). I was really, really planning on keeping this one as a backup for my music system. Now if that fails, I will have to switch to PC (EEEEK!) since so few TT systems run Logic.

Any advice would be appreciated. I wish that I had access to a TT diagnostic cart. Anyone have a spare that they would like to trade for something?

Aloha!

Well, I have, too, seen (some years ago) some sort of linux running on a
MegaST, but I do not know which varant it was, or how useful, if at all,
it was.

I'm not sure if it'll help, I think Ataris diagnosticas only

reported to screen, but perhaps wrong. It should send to RS-232
if it had any sense, and plug it into to a computer running
terminal software with null modem cable.

Yes I thought we were talking about CCC, do not know why.

I live in Tunbridge Wells, it is a good distance no?

Elliot...

The diagnostic cart will send to the rs-232 then to a computer running terminal software. Ive done it on the ST with a diagnostic cart but not on a TT since I need a TT diagnostic cart.

Don

Does anyone have a set of ROMs for the TT diagnostic cart or want to trade a ST diagnostic cart for a TT diagnostic cart?

>For connections , it is quite simple!
in for video, pal or svhs for exemple, and the same for out.
One simple synoptic :

Vcr reader out to in video genlock
Genlock out video to Vcr recorder or scart television.
For atari computer, it is a kind of "thru"
The genlock is plug, between the computer and rvb atari monitor.
So the out signal from computer to in of the genlock
The out signal of genlock to the atari monitor.
(for monitoring.....)

3 simples switch hardware on genlock:
video, or rvb, or both
pal, computer screen, mix or key for luma key.

Without specific software, you can test the 3 options:-)

Gemtoo!

Greetings,

For my latest trick, somehow - Magic runs on one of my TT030 machines, but produces a Gemdos error and crashes on the other. I took the hard disk from one, swapped it back and forth, and inexplicably, Magic refuses to run on one of the machines.

Ideas?

Had similar problems with two older TT:s (with TOS 3.01). I tried and
took out the TT RAM and then MagiC runned perfect on both. Now MagiC runs
fine on one of them _with_ TT RAM. The other still only with ST RAM.

Interersting was that the same (original) TT RAM only worked in one of
them.

Just now I'm actually coping the MagiC 6.20 installation floppies from a
third TT (with HD floppy and the one I'm writing this with) to one of the
others TT's via my STinG network using BNET. Thanks to the backgound
floppy functions it works pretty well.

Actually - nothing except the board revision. I tried swapping memory
boards, removing them, etc... TOS versions match. I'm stumped. I
suppose that I should test the on board RAM in case a chip is bad?

Cheers!

```

Ok. I've recently updated my studio, adding another synth module and table top sampler. So, the need for a second MIDI OUT port from my Falcon was obvious. I've had the MIDIman "Mini MacMan" box, that works through the Falcon's LAN port (using a special MROS driver) for quite some time, but never used it much, aside from testing it when I initially got it

Anyway, I got everything hooked up, and re-routed things in my MIDI patchbay. Everything appeared to be ok. Cubase launches, loads the MROS LAN port driver, after which time I plug in the Mini MacMan (since as the README file states, if you have it plugged in BEFORE the MROS driver is loaded, your Falcon basically won't boot or work).

The problem is, with it up and running, I'm getting very frequent multiple-bomb crashes while recording MIDI data. And for the record, I'm only using the Mini MacMan's MIDI OUT. All incoming MIDI data goes through the Falcon's standard MIDI IN port.

I tried running CAF under both HD Driver, and ICD Pro, and disabled _everything_ , but the crashes remained. The only thing that stopped them was unloading the MROS lanport driver, and disconnecting the Mini MacMan. So unfortunately, this solution for an extra 16 MIDI out channels isn't going to work for me.
:-(

My question is, what are my options now? What other device can be used with the Falcon and Cubase Audio to add an additional 16 MIDI out channels _reliably_?

I figure I'll be looking in the USED market for any solution to the problem, although I seem to remember discussion of some sort of serial port MIDI OUT expander from Mario Becroft; or was that ONLY for STs?

If there aren't any other options for me, I suppose I could break out the old STE, and run normal Cubase on it, synchronized to the Falcon running Cubase Audio - but this would hardly be an ideal solution!
Or, if there's a viable "ST/STE-only" MIDI OUT expander, I suppose I could just use the STE for MIDI/Cubase again (although I no longer have my monochrome monitor!). This wouldn't be too bad actually, since I'm no longer using the audio portion of Cubase Audio with the Falcon. I've recently switched over to SoundPool's Audio Tracker.

Thanks for the help in advance!

-Paul

Hi Paul,

I use a Soundpool MO4 which plugs into the printer port and give me 4 extra MIDI out ports in Cubase Audio with no problems. They may be hard to find, but worth it.

Dylan O'Brien

Okay - so if anyone's listening...

As I think back, the last thing that I was able to do with this TT was
testing simms. I've been trying to weed out the defective ones.

It is slightly possible that the last time I tried to boot, one of the
simms was not seated completely in the TT ram board.

Can anyone think of what I may have fried if this was the case?

Also, would a TT diagnostic card and test rig be likely to be able to
diagnose this?

Thanks!

John Perez

Hi Hallvard,

>1) I can't find any specs for these. How much memory can they handle?

128 kilobytes each I think. The C is for CMOS I think, so it
would appear yours are listed at the bottom of the below list.

>2) Did TOS 2.06 come in other types of EPROM chips, or possibly also ROM
>chips like with older TOS versions?

Depends who made them. I have them in ROMs with UV window in.

>Looking at the STe circuit schematics, the section about the TOS chips,
>there's a table showing the different jumper settings for different
>EPROMs, so obviously there's provisions for using a wide variety of
>types. The following are listed:
>
>- 27-256
>- 27-512
>- 57-1001/27C-1000/53-1000
>- 27-010/57-1000/27C-1001
>
>Why did Atari make it possible to use so many different types of
>EPROM/ROM chips?

So they could use cheapest parts around. And it doesn't
complicate things on hardware. Just switchs some lines to Vcc
or GND, and the A17 (thats off the top of my head!)

>I've heard that it's possible to burn your own EPROMs with
>several TOS
>versions and even MagiC inside... interesting.

Yes.

Never mind I found the answer Monochrome only as the horizontal scan
has to sync to 15.75 for low and med resolutions. Where as it will
work Mono at 35. Sorry for wasting anyones time.

Hi Hallvard,

>Did you buy yours from an Atari dealer (I'm assuming that you do indeed
>have TOS 2.06) -what kind of chips did you get?

TUS in the UK. It came in larger ROMs so that 1.62 and 2.06
existed. Simple toggle switch.

>> >I've heard that it's possible to burn your own EPROMs with
>> >several TOS
>> >versions and even MagiC inside... interesting.
>>
>> Yes.
>
>I'd like to give this a go some time.

I have my ROMs in NVRAM but still haven't really tried leaving
it for nights on end, running of the small NiCd battery. This
way I am able to put whatever I want into ROM, in an instant.
It needs Magics header modified but I think there are utilitys

around to do this.

Hi Hallvard

| Why did Atari make it possible to use so many different types of
| EPROM/ROM chips?

In order to keep up with commodity (ROM RAM EEPROM) prices

| I've heard that it's possible to burn your own EPROMs with several TOS
| versions and even MagiC inside... interesting.

My MegaSTe has EEPROMs in, and they are modified for the PAK.

| PS. yes, I know that the chips aren't written with an apostrophe (-) in
| them, but it makes for easier reading.

You mean a hyphen dont you?.

Hi Peter

| Wish I knew which pin was found to be bent. I thought the guy said it
| was top right, but that would be Red.

Looking at the rear of the machine with the keyboard furthest away, Top Right hand corner pin.

I bought mine from a dealer, and they were definitely EPROMS, with
a window which stupidly was *not* covered with the identifying
sticker!

Regards, /Peter/

Thanks Steve!

That would be pin 10, a GROUND. Any idea what it was touching by
any chance? I mean the pin below (19 = Monitor select 0) or the
shell?

My TUS ROMs have no sticker over the window :)  If I left it
with top off in sunny day for a day or so I'd probably end up
with blank ROMs!

128KB each, so 256kB total for a pair of chips.

>Looking at the STe circuit schematics, the section about the TOS chips,

>- 27-010/57-1000/27C-1001
>
>Why did Atari make it possible to use so many different types of
>EPROM/ROM chips?

Why not? It allows some flexibility and I suspect that Atari itself used more than one type in different production batches of (m)STe computers. However, I do not know how could 27256 have been used in a STe, because eight of them would have been needed for 256kB TOSes- are there eight sockets on the board?

Notice that there are two different settings above for 1MBit (27C-1***) EPROM chips. I suspect, but can not be positive, that this is to allow for different pinouts of two versions of 1MBit chips- depending on the manufacturer, there are 1Mbit EPROM chips which are identicaly named(!) but *with different assignment of pins* - a very unpleasant detail; this is explained somewhere in Chips'n'tips...

>The cheapest ones would probably be the ones I got, with the lowest
>memory capacity.

Btw. 27-256 and 27-512 are 28-pin chips; 27-1001, 27-0010 etc. have 32-pins.

Another important aspect affecting the price is access time. Usually this is written on the chip something like 27C512-150 meaning 150ns access time. For a standard ST(e) this is not very important and I think that even chips as slow as 250ns chips were used in Ataris, but I recall reading somewhere that for 16MHz ROM access (as in some accelerated designs or MSte) access time should be 150ns or 120ns.

My estimate is that with a 60mAh NiCd battery it should hold for
a month or so. But a better estimate might be obtained by measuring
current drain when the chips are in standby-state (I sort of remember
that when supply voltage of (some of) those SRAMs is lowered to
about 3.5V the chip enters some sort of sleep mode with the contents
remaining preserved). As the battery can get recharged (if appropriate
circuit is made) every time the computer is turned on, holding time of
one month is practically forever for anyone who uses the machine
more-less regularily.

>It needs Magics header modified but I think there are utilitys
>around to do this.

It would be interesting to know are these utilities still valid
for the latest versions of Magic (i.e. I know they support magic
4.* and 5.* but what about 6.* ?)

Definitely, although it may be possible that some dealers had a license with
a one-for-all payment scheme, ie. without royalties for every single EPROM
set.

Hi

I have noticed what I think is an error in the Falcon COMBEL code for generating the LDS/UDS for ROM port, exp connector and so on. This would explain a number of things that fail to work on the Falcon, I believe Michael Ruge may have said something similar but my German is not that good. Anyway on the ST and Falcon I did some testing.

Three programs were written in assembler to read byte at $FB0000, a byte at $FB0001 and a word at $FB0000.

L is for a low state during ROM3, H for high state during ROM3.

	ST		Falcon	
	LDS	UDS	LDS	UDS
Odd.b	L	H	L	L
Even.b	H	L	L	L
Word.w	L	L	L	L

Is my COMBEL dead on Rev D/C Falcon is this one of the other Falcons "features"? The ST results follow the 68000 docs perfectly. I know others have had problems trying to use the LDS/UDS to derive an A0, which was one of my first experiments.

Thanks

Hi Djordje,

>I sort of remember >that when supply voltage of (some of) those
>SRAMs is lowered to >about 3.5V the chip enters some sort of
>sleep mode with the contents >remaining preserved).

If I put right comination on the two CS lines I can go into sleep mode. I can't remember the current drain but it was very little. Also, the voltage can drop to something like 2.2v before you are in danger of losing the data :) My 3.6V cell should be fine. The only thing that holds me back is the fact that I have so many devices needing chip selects I wonder if it would be more economical to use one central GAL to provide all these address, reducing amount of address lines being loaded.

>It would be interesting to know are these utilities still valid
>for the latest versions of Magic (i.e. I know they support magic
>4.* and 5.* but what about 6.* ?)

Yes, I wonder. I think it was for V5. I only have 6.01. AFAIK it requires modify the pointer in it, to point to TOS 2.06 area. I don't know what kind of program would be useful to use. TT-Digger, AFAIK is only a viewer.

It runs NVDI 2.5, Cubase and Notator Logic 2.5 extremely

well but NOT Notator SL.

Mega STE is better for Notator SL.

Is there an ST accelerator that will run Notator SL?

This is not an error. It may be unfortunate if you try to do things that these signals were not designed for (like outputting data to the ROM port), but it is completely valid behaviour for a CPU to read more data than it needs and throw away the unused parts - many CPUs do it that way.

I am not sure if it is the 68030 or the falcon bus logic, but since the address areas were designed for memory devices, which be definition are prefetcheable, this does not hurt.

If it is the 68030, it might help to declare these areas as cache-inhibited, non-prefetcheable - I am not sure what the correct terms for the 68030 MMU are, the 68040/68060 has a "non-cached, serialized" mode that can be used for non-prefetchable IO spaces.

LDS/UDS are not meant to be a replacement for A0. Byte enables on a 16/32 bit bus are only really needed on write accesses.

Definitely. *I* have only seen 2.06 in 27C010 (or pin-compatible) EPROMs,
but Atari definitely used the ROMs with a different pin-outs in STE
machines.

(Plz dont hit me for also posting it at comp.sys.atari.st, *.tech seems to
be fitting better.. sorry)

Hi all,

I have some trouble connecting a SH205 to my MEGA ST2.

(and I am an Atari Newbie... ;)

I purchased all via eBay and got the stuff today. The cable was already connected from HARDDISK IN -> MEGA ST

When I tried to start the Atari without any Disks in the Floppy I just saw three little bombs (or whatever) on the startscreen..

So I started the Atari with an inserted Disk. GEM Desktop appeared fast... then I tried to add the Harddisk to the Desktop.... but after adding it as "C" (upper case) the computer still tells me that this drive is invalid..

During bootup the Harddisk seems to start normally (no strange noises, the "active"-light flashes... but after the boot BOTH lights on the Harddisk are ON.. always... somehow strange for my taste..

Anybody has any hints?

thanx for helping!

Dennis Knake

That is true.  But, what I say is, the Falcon port does not
follow the same as the ST.  Would this have really taken time to
implement, or is there a reason why it cannot be just like an
ST.  Perhaps another reminder on the Falcon being replaced with
68030 in last minute?

Thanks.

Hi Hallvard

| I'm interested in looked into hardware accelerators for my STe and have
| read the specs for TUS' Veloce+ with great interest.
| Anyone using it? Any other accelerators worth looking into.

Ive only heard good about the Veloce board, but lots of bad about some
companies that fitted them.
Its got a 68020 hasnt it?.

| Depending on price I'd be interested in buying one as well -especially
| the Veloce+ as it's also got room for memory upgrades.
```

Is that the one with an IDE port as well,

EE&OE

Hi Hallvard

| > | Why did Atari make it possible to use so many different types of
| > | EPROM/ROM chips?
| >
| > In order to keep up with commodity (ROM RAM EEPROM) prices

|
| So did Atari actually supply TOS 2.06 in different kind of EPROMs, or
| even pre-programmed ROM chips (i.e. non-erasable)?

I have only ever seen 2.06 in EEPROM's but other TOS's in different
permutations. If you think about it, the next major TOS revision was
designed to be Upgraded (Falcom TOS)

| > | I've heard that it's possible to burn your own EPROMs with several TOS
| > | versions and even MagiC inside... interesting.
| >
| > My MegaSTe has EEPROMs in, and they are modified for the PAK.
|
| But these weren't supplied by Atari, but rather programmed by yourself,
| weren't they?

Supplied and blown by Mr PAK, but proves that patching is possible.

| > | PS. yes, I know that the chips aren't written with an apostrophe (-)
in
| > | them, but it makes for easier reading.
| >
| > You mean a hyphen dont you?.
|
| Oops. Yes, indeed.

God help us, its you writing the new bible. 8-)

Hi Lyndon

| >I bought mine from a dealer, and they were definitely EPROMS, with
| >a window which stupidly was *not* covered with the identifying
| >sticker!
|
| My TUS ROMs have no sticker over the window :)  If I left it
| with top off in sunny day for a day or so I'd probably end up
| with blank ROMs!

It would take more than a few days sun to erase/corrupt an eeprom, but
prolonged exposure would cause 'flaky bits'. I agree that was a glaring cock
up for such a respected company.

Theborg,

if you've used pc's you'll find that they are somewhat similar to atari's.
When you connect up the atari harddrive, it isn't formatted or partitioned
or anything, so hopefully a disk came with the harddrive like "ICD
Utilities" or "AHDI" This will let you format the hard drive, partition
it, (make a drive C) and then install and auto booter. What this will do
is cause the system to boot off the hard drive. Do you have this disk or
any hard drive "drivers"?

Mark

Not a bad idea, but wouldn't a simple 74HCT154 4-to-16 line decoder do the
job as well (15ns propagation delay; I don't know if there is a 74F154

for faster response)? With one 74HCT154 you get 1MB segments decoded which
would be enough for a lot of cases.

True, but I had some other options on switch. I had read/write
protect, I guess that could be done without GAL thinking about
it :) But, it was mainly a test to work out programming GALs.

As you say, it is simply a address decoder. What I may do is use one GAL (20v8) and a 4-16 line decoder off this. I'd then be able to have 16 chip selects, each one easily configurable to whatever address range I want. Propogation may be a prob, and i just checked books and it doesn't seem available, infact, neither does HCT159. However, there is HCT154, although I'm not sure if this is OK to be using. 1MB of address space, by using *just* a 159 is too much for some things, that are in the $F00000 to $FFFFFF area. For instance, IDE, ISA registers, SCC just to name a few.

I've gotten my Atari TT out again and I notice the time isn't kept anymore. Even when I reset it it reverts back to 12:00am. I presume the battery for the clock/calendar is dead. There's no mention in the manual, other than take it to a dealer (LOL). Any folks know what type of battery, where it's located, and the way to deal with it? Thanks.

Any kind of 6V battery is fine. I'm using four AA-cells in mine, it's cheap and has worked perfectly for more than three years now.

If it looses time and date when you simply hit the reset button with power still on something is wrong. The RT clock should get power from the PSU to keep the time anyway.

If the time is lost only after a power down it's most likely the battery that is dead.

>the clock/calendar is dead. There's no mention in the manual, other than
>take it to a dealer (LOL). Any folks know what type of battery, where it's
>located, and the way to deal with it? Thanks.

AFAIK there are two different types of batteries depending on TT model. The older with metal shielding inside takes a 6 Volt Lithium battery. I have replaced mine with a four AA 1.5 Volt alkaline batteries and this works fine.

The battery is located under the metal shielding next to the external SCSI connector, glued to the case.It's black with red and white cables and carries the text "Lithium Battery". Easy to locate.

Newer TT's with brown paint inside the cover as shielding use another type of battery. I'm am very interested in the voltage as I bought a second hand TT of this type with the battery missing. I seem to recall that it should use 3 or maybe 4.5 Volts. But maybe I havn't looked carefully enough for small button cells on the motherboard? The old battery connector is in the same place as on the older motherboards so I guess I simply assumed the battery was removed...

Anyone who could explain what battery Voltages different TT motherboards uses and how to distinguish between them?

Hi Hallvard,

>Yup, that's the one.
>So, has anyone got such a board which they would like to part with?

TUS made them in the UK. I have advert if you'd like a scan.
They were going to make 24MHz version but it never happened,
perhaps not being able to find enough 68020s @ 24MHz in quantity?
I know there was some guy on newsgroup who had a Veloce, google
groups will pick him up. When I last talked to him about it he
said he liked it and wouldn't part!

>Yeah, as an option. Along with an additional 2 or 4 Mbytes of TT FastRAM
>as far as I remember.
>Would do nicely in my 19" racked STe.

I have just the IDE part, it's good. The RAM cost a lot more,
IIRC the 0 RAM was �99, 2MB was �149 and full 4MB was �199. I
wonder if it was based on DRAM or possibly SRAM. DRAM was
cheap, although, the price of FPM/EDO as probably rocketed now :)

As it turned out, there was nothing wrong with my computer. I believe the problem was due to dirty contacts on my house AC circuit breaker.

Specifically, I have had a flickering overhead light for several months now. A week ago I replaced the dimmer switch, which cured both the light and reboot problem. However, the reboot problem mostly occured with the light off, so I don't really believe the switch was the cause. Since the computer and the light were on the same breaker, cycling the breaker may have been all that was needed (for both problems).

I'm not curious enough to try putting the old switch back in.

Hi Hallvard,

>But does this actually have anything at all do do with the STe in
>particular? I thought a genlock was more of a standalone device.
>What makes the STe more capable of this than previous ST models?

I think one pulls the GPO pin low on the monitor port and it's
then possible to feed a clock signal into the mono out pin.
This clock signal is actually feed straight into Shifter IIRC.
So, it should be around 32MHz. What this means is, it should be
possible to increase the speed of STE, in low or mdeium res,

simply by plugging a device into the monitor port.

Back to your point, you get video signal, strip it of it's sync
data and feed this into the STE. Every thing will be "in sync"
together so you can then mix the RGB data together. No software
is needed but I believe some scrollers for home video credits
etc, could do software overscanning so you get rid of the border.

Not too hard to do. There are jumpers in back of the drive that have to
be changed. Took me about 30 minutes before I had it right.

Not sure - I would have to look in the 68030 data sheet if this is caused by
the 68030, or if it was just lazyness from the falcon designers.

I hope so maybe my english sounds a little bit strange, but I am
native german. Dont bother to correct me. Also I translate not word by
word - only the sense is there ;-)

> --------------------
> Achtung: ATARI hat ab Werk ROM's mit 28 Pins eingesetzt, die das TOS
> 1.06 enthalten, hier gilt die Jumperbelegung f�r den Typ 27C1000!
> -------------------

Attention: Atari uses ROMs with 28 Pins for TOS 1.06. You need the
Jumper-Setting of the type 27C1000

> The same seems to be repeated here, but with more detail:
>
> --------------------------------
> Desweiteren kann man verschiedene EPROM-Typen einsetzen:
>
> | Epromtyp | W102 | W103 | W104 |

> fehlenden Sockelpins nachger�stet werden (aus einem anderen Sockel
> kurzerhand die Pins herausl�sen und einloten)!
> ---------------------------------

Also you can use different EPROM types:

Eprom type	W102	W103	W104
27256	no difference	1 and 2	free
27512	2 and 3	2 and 3	free

571001/27C1000/531000	2 and 3	2 and 3	2 and 3
27010/571000/27C1001	1 and 2	2 and 3	1 and 2

Attention: Atari used in Production for TOS 1.06/1.62 ROMs wit 28 Pins. They will need the Jumper settings of the type 27C1000. If there are only 28pin Sockets on the board, you must add the missing Pins. (soldering from another socket)

> --

What is in general the differnce between the 27C1001 and 27C010 1 MBit EPROM?

This EPROMS are kompatible (A16 = pin 2, OE = pin 24) | This EPROMS are not kompatible (A16 = pin 24, OE = pin 2)

	27010		27100
AMD	27C010	Fujitsu	27C1000
Hitachi	27C101	Hitachi	27C301
Mitsubishi	27C101	Mitsubishi	27C100
Toshiba	27C1000	Toshiba	27C1001
NEC	27C1001	NEC	27C1000
Intel	27010, 27C010		
SGS-Thomson	27C1001		
Texas Instr.	27C010		

This EPROM types are used in Atari Computer and also in Zyxel Modem.

Hope that helps

Greetings

Michael

hi!

I read with attention your request about genlock
It still exist another product compagny "satellite & television"
they produce genlock for atari, amiga, mac, pc.

The genlock is "a lock frequency"to use graphic computer on real video signal:rvb, pal, svhs:-)
The important thing is it is "luma key video effect"
All the black color are going thru to mix picture.
(At the other hand it still exist "blue box : chroma key, another subject)
It was the 2 historical "analog video classic effect", with cut&wipe:-)
applications:
 generic text, logo with scroll, roll.
But a lot fun other possibility: matte/luma&mask, incrust with 256 levels of greyscale, cartoon effect, medical effect, smog effect...., multi-layer effect, direct paint on video in realtime,
clock effect......
With a ste, it still exist prg with genlock support.
But of course, the best is the falcon multimedia:-)
The videl have a genlock possibility too:-)
bye

The 68030 doesn't use the LDS/UDS but has all address pins
available, down to A0. I think it uses two lines, SIZE0 and
SIZE1. This give the possibility to use 8,16,24 and 32bit
chunks of data. I only assume that the Combel has some code to
regenerate the UDS/LDS, which in Falcon, is labbeled as xLDS and
xUDS. Perhaps so it is clear it is not a true LDS/UDS coming
direct from CPU. I think the bus is terminated with DSACK0 and
DSACK1. Similar to DTACK in ST I think. I did look over the
68030 datasheet last year. Seeing as the 68030 does have A0,
it's odd not having it on the expansion port :) Almost as good
as the Mega port with no power!

A bit OT, but it appears, in Chips'n'Chips that D0-D31 are
present on Falcon CPU, but *not* D24-D31!

And, the Falcon GAL chips are code locked! Tried it before :)
Still, I could work it out if need be, the CT2 totally replaces
these, or was it just two? I have details in a magazine.

Hi (replying to my last post)

>And, the Falcon GAL chips are code locked! Tried it before :)
>Still, I could work it out if need be, the CT2 totally replaces
>these, or was it just two? I have details in a magazine.

Ah, U62 is not locked, which does the LDS/UDS out of A0, SIZ0
and SIZ1. A quick bit of reverse engineering and I have the
boolean logic :) I now see the place where this error is
occuring. The GAL takes R/W into account. When /DS (Data
Strobe) is low, and R/W is high, LDS and UDS come low. It
doesn't seem to matter what the size of the transfer is or
on what part of the databus it is happening. This only seems to
be happening on Writes.

So, to sum it all up, the Falcon cartridge port can not be used
to get an A0, or writing with address port. Although this was
never a legal way of doing things on the ST, it should have been
aware at the time of Falcon design. I believe there were many
docs, devices out there using the port to write data by 1992.
Scanners, PCM sound chips, IDE CDROMs, I'm sure a lot more.

One could patch the GAL, but I don't think it will be worth it.

Hi Hallvard,

>My next question is if such a device can easily be made instead of
>buying a commercially available Genlock?
>What actually connects where when using a Genlock with an STe?

Well, I don't believe they are that easy. You need a chip that
can decode the sync data. These are available, but I wouldn't
be sure how to generate the 32MHz clock. It would be easier to
Genlock and STE to ST(E). I think all you'd do is put the 32MHz
clock from ST into STE monitor port, make it use the ST sync
rates and the two will be combined. You then use video
amplifier to mix the RGB data and feed it into whatever. But
what applications need ST genlocked to STE? :)
Amiga docs should have some stuff on genlocking.

>Yeah, getting rid of the border would be essential. I can't remember the
>standard PAL resolution, but believe it's somewhere around 570x360
>roughly. To be able to overlay something like this the screen size would
>need to be the same on the STe as on the TV (i.e. video input signal),
>so could this be done using software tricks?

I don't think it *needs* to be, it's just that if it was then
you'd be able to place text in border space. For instance, text
scrolling of credits would rise from bottom of picture, not from
a little way up :)

>Does this also mean that the genlock has its own video output connector,
>but uses the 13 pin DIN plug from the STe as one of its video sources?

Yes.

>the 3.5's were larger capacity and more easily available.
>I think perhaps you are talking about 8bit atari. That _did_ use 5.25 disks.

Uh! do you *really* believe what you write ? I have been using an
external 720k 5.25" on both my 1040 STF and - further - my MegaST4!
At this time, 5.25 floppies were about 5 times ceapper than 3.25 ones
and it was worth using them - despites their size!
Both the 3.5 and 5.25 floppies were formatted using FastCopy Pro,
which allowed up to 84 tracks / 11 sectors. I had nearly no problems
with this, except with Verbatim floppies that were highly unreliable!
And, to answer Brume's question, no, it's impossible to read TOS <1.4
formatted floppies on PCs.

Take a PC PSU, rearrange the wires of P8 and P9 so they match the
order of the TT's PSU's connector. Then plug and use.

```

See my previous post : you need an old PC PSU, with the P8 and P9
connectors, or P1 & P2 or PS1 & PS2, depending of the model.
Normally RED is +5 VDC, YELLOW is +12 VDC, BLACK is GND, WHITE is
-5 VDC and I don't know about BLUE and ORANGE.

>Anyway, since the cleaning my TT has been running much longer between
>crashes. So long as I can get it to run for at least 4 hours at a

So you must be talking about me then, as I was the only
person who fitted them. If you have anything to say then
lets hear it in public to the group instead of your insipid
comments that only make you look foolish. The main
reason I left the Atari scene was because of people like
you.
I for one am fed up of your comments so if you have
a complaint about Veloce or it's 'FITTERS' then lets hear it
otherwise apologise to the group for your fictitious postings.

> Its got a 68020 hasnt it?.

Certainly has. Full 32Bit 0 wait state TT RAM.

A brief history about veloce+ if your interested.

It's quite easy to accelerate an STE's 68000 processor as
Motorola did quite a fine job with their processors. The difficulty
putting it into the STE was that Atari's DMA system was flaky so say the
least.
The first Veloce used a 24MHZ 68000 with cache ram and ran
smoothly but didn't give quite the speed I was looking for and
had problems with DMA so never went into production

The answer was to use a 68020 processor with it's internal cache at 16MHZ
which was very stable and ran the DMA perfectly. It also had Tos 2.06 32
bit. This was
released as the original veloce.
There was a 24MHZ version but once again the DMA problem appeared so it
wasn't released.

To get an even greater speed increase it was decided to take a veloce
and add 32 bit, 0 wait state SRAM alongside the 32 bit Tos Roms.
The 512K * 8 SRAM parts where expensive compared to DRAM
but this wasn't a problem as only a couple of megs where required
for most applications. This board was released as the Veloce+.

Further developments where ongoing including an STE Veloce+
with 68030 at 32 and 48MHZ but the market had started to shrink by
that time and the development cost was too high.
Veloce Falcon (yep I did one of these to) was 32MHZ, 32 bit with
32Meg DRAM. The bugs had been ironed out (yep the DMA in the
Falcon was also flaky) and the first 50 PCB's had arrived when
other systems started to appear claiming higher speeds and _stability_?.
I should have continued with it as at least my system was stable unlike
some others that came to light later on. (oh well)

It is nice to hear that Veloce is still talked about now and again. They are still produced in small quantities and I have only ever had 1 back for repair.

Enjoy your Atari's,

Dave

Hello,

For thost that have been following my PCMCIA testing, namely various types of media, I have now tested PC Card ATA Flash. I bought a 128mb card and a 256mb card and am happy to report they work fine. The 256mb card benchmarked at 1000kb/sec. All testing thus far has been on my Hades060. Anyway there you have it.

Right. However, without a closer look at the datasheet, we still don't know what kind of bus cycles the 68030 uses on a read access on the cartridge port: if it does in fact do a 16-bit read, even if only 8 bits are needed, then even a modified GAL can't generate "correct" UDS/LDS signals from that.

Hi Andreas,

>There was a 5.25" Drive for the Atari ST, the PC551 Drive.
>But this was intended only for Data Transfer between
>PCs and Atari ST in the early days!

There were also drives available from third parties, a well known brand used to be Cumana. These drives were 100% compatible with the 3.5" drives, you could store, load or even lounch apps from them. A 5.25" diskette way back in 1986 was a lot cheaper then the 3.5" disks. IMO they are more reliable as well...

>As far as I know this used a special software and you could not format a
>5.25" disk in ST format.

No, you can format them straight from the Atari desktop and just like with 3.5" disks you can exceed the 720Kb limit by using software like FCopy or ECopy. In fact formatting a 5.25" disk with 82 tracks, 11 sectors is a hell of a lot more reliable then trzing to do the same thing with a 3.5" disk.

Most of these drives have a selector to let you switch the drive between 40 or 80 track operation. The old PC software used to be distributed in that format, so people using a PC emulator were able to load and save their work very easily.

Cheers from Belgium
Dennis

In the file I am reading regarding the upgrade, the following text is not possible with the ST that only has four empty DRAM sockets:

8. Take wires from the pin 2s of the first group of eight DRAMs
to pins 3, 6, 10, 13, 16, 20, 23, 25 on SIP1.
Similarly connect the pin 2s of the second group of DRAMs to
pins 3, 6, 10, 13, 16, 20, 23, 25 on SIP2.

On the ST motherboard, I only have two groups of four drams, one with 512k and the other empty. what goes to pins 16,20,23 and 25 on the SIP's?

Moin Leute,

hab mal wieder ein dringendes anliegen, wo ich im Netz leider auf keinerlei

infos gestossen bin.
Im Laufe der Zeit vergr�ssert sich meine Sammlung an STs ja immer mehr. Ich
habe jetzt einen Mega ST1 mit PAK/3 50 MHz / 4 MByte RAM / undefinierte
PROTAR 4ML (B) Graphikkarte 1.1 .
Auf der Karte ist ein TMS34061 Grafikchip untergebracht. Das Problem ist,
ich w�rde gerne die Technischen Daten / Datenblatt / Anleitung haben, sowie
geeignete Treiber damit ich dort auch einen passenden Monitor anschliessen
kann.

Chao Timo

Four bombs are "illegal instruction" but this would not mean much
in this situation. IIRC they appear in Gemulator when you do not
specify boot disk correctly. For a start, try setting it to boot from
the real C:\ drive. I remember having problems trying to make it boot
from another disk or partition, even though from the configuration
dialog it seems obvious how it should be set-up.

<snip>
>Since
> the connectors are not keyed on most PCs
<snip>

For information, the PC connectors are keyed, just not in the same way.

ALL cables that I have seen in at least the last five years have had these
marks on them although ATMM I don't know which way they should be.
I will take the side off my PC and have a look later on in the morning but I
know all PC cables are keyed.

Instead of having the blob on them so you can only insert them one way up, they have two small cut out grooves, one to the left and one to the right of the connector. These stipulate which way up the plug is to be inserted. It is a bit like the rule with the old AT power connectors, you can plug them in either way round but if you get them wrong, you risk losing your motherboard!

There is always a nice and easy rule for working out which way round to fit a cable, you just find that the information either isn't easy to find or it isn't given in a manual. (probably the same thing). I mean if a standard x86 user can work out which way to fit the cables there has to be an easy way to do it doesn't there?

OK I will check soon and get back to you all.

Tim

I've just downloaded CAB v.2.8 BetaTest Demo and I can't figure out who to
E-Mail to get the registration key. Can someone E-Mail me the right E-Mail
address? Or registration instructions in English. The important thing is I
I need to be E-Mailed.

I have one of these enclosures for my ST,

Unfortunatly the drive itself died many years ago and has been thrown out. i
still have the case and powersupply.

what type of 5.25" drive goes in there?? i tryed some old 360K drives, but
they could only go upto 40 tracks. i know i used to be able to do 80 tracks
and 720k.

Mee too ;-)

Noname 5.25" drive with 14-pin DIN plug, internal PSU, 40/80 track switch.
If anyone wants it: make an offer (shipping to Germany preferred), otherwise
it gets junked soon.

cu
Michael

Hi,

I have started on an ISA controller, for internal fitting
straight onto bus. This is for graphics card (ET4000) but
should be possible to use other cards. It does not support DMA,
I think the DMA on ST wouldn't work when the address is mapped
outside of the STRAM. One thought, is implementing IRQ good?
The ET4000 doesn't need it. Anyway, here is my rough GAL
equations. S4 and S6 are the CPU states as in the 68000 PDF.
CHRDY is used if waitstates are needed, by holding off DTACK.
Pinouts are to be completed and the addresses.

I'm just interested if anyone else is interested ;) I know Panther exists but this isn't open source, or words to that effect. I'll be trying my design out sometime with ET4000 + NVDI 5. I guess this should be portable to the TT or Falcon, perhaps with some tweaking of the timing.

Thanks!

My TT has started having intermittant hard crashes. It happens after a few hours or running, but once it starts it keeps crashing over and over. You have to let it cool down again before you can use it.

I opened it up, dusted, and reseated all the socket chips. I inspected the power supply for leaky electrolitic capacitors, but no joy. The fan works fine.

I suspect the power supply, but don't want to replace it unless I'm sure. Anyone know the test voltages, etc? Is it a standard item, or will I have to call Best Electronics?

Hi John,

>I suspect the power supply, but don't want to replace it unless I'm
>sure. Anyone know the test voltages, etc? Is it a standard item,
>or will I have to call Best Electronics?

You have a mulitmeter? Try hooking it up to read voltage on the
5v supply. Run the TT for hours as you say and every now and
again check the voltage. Perhaps an osciloscope would be more
useful? Does sound like the PSU getting old or heat problem.
But you say the fan is working so I would assume the PSU too.

The TT has a standard AT powerconnector, so any AT powersupply will work
fine. The problem is to find at AT PSU that actually fits inside the TT...
However, you could try with a known good AT PSU for a few hours just to
check if it really is your PSU that's dying.

You should be able to, provided that the 5 1/4" disks were formatted on
a PC *OR* formatted using TOS 1.4 or higher. I seem to remember that disks
formatted with TOS 1.0 or 1.2 could not be read on a PC until the boot
sector was "PC-ized" using DCFormatter or a similar utility.

Hope this helps.

5 1/4" drives come in various configurations. The most popular were the standard 360K drives, which were then supplanted by drives which could format both 360K and 1.2M. But there were also some drives which could format 360K *AND* 720K (therefore useless for 1.2M), or others that could format 720K *AND* 1.2M (therefore useless for 360K). For obvious reasons, the last two didn't really catch on in the PC World, although examples can still be found in my basement...

Any Atari ST can use a 5 1/4" drive that will format 360K and 720K, although it may be necessary to construct a small interface to make sure the signals are synching properly. (I built one of these and should still have the instruction in my dusty crypts somewhere if anyone is still interested.)

HD 5 1/4" drives for 1.2M disks may need the aforementioned interface and will definitely need an ST that will format HD disks *OR* a mod

```
to enable a stock ST to do so, which is possible if you have (if
I remember correctly) a 1772-02 floppy controller chip. (Again, the
mod is available if anyone is still interested.)

Yes - it would enable you to use network cards. For this purpose, *two* ISA
slots would also be a great idea ;-)

Yes :) I believe you made a VME to ISA adaptor?
I have a riser card that came from a 386 pizza box dying to be
put to a good use!

Anyway, it was suggested to use the ACIA interupt. After the
interupt routine has checked the ACIA status registers the
routine should then check an address which would be the IRQ
status for ISA. Using a single byte one could have 8 ISA IRQs.
I also believe the ISA IRQs stay low until the card has been
serviced which would be useful. I think a 244 could be used to
direct all 8 IRQs to the D8-15 on CPU.

Cheers!

>status for ISA. Using a single byte one could have 8 ISA IRQs.

Don't do that. Handling two ACIAs on one interrupt line is bad enough, and
reliably hooking your routine into that vector (*after* the MIDI and IKBD
routines in the OS) will not be easy.

Use a free interrupt on the CPU - either auto-vector or a vectored
interrupt.

>I also believe the ISA IRQs stay low until the card has been
>serviced which would be useful.

Correct.

I looked at the spare IPL line not used, -IPL0. However, these seem to be used in in TT/Mega STE. I think level 3 would be best if I choose a direct to CPU IRQ. Anyway, auto vectors look fine. None of my books really say which one has what advantages/disadvantages but the auto vector seems better as I know where the vector is in memory. I guess it's just a case of modify the address/value at $6C in RAM and point this to my new ISR. ISR checks an address in memory to see which ISA IRQ triggered it. I think this is cascaded IRQ, similar to PC on IRQ2.

Hi John,

Are you still in Houston?

Have you got the TT schematics? I have a hard copy that I could pull
out if you still need the power supply voltage information. I was
going to say the schematics are on line too .. but it looks like the
TT schematics are the mising link there. Maybe I should scan my hard
copy into a PDF file one of these days.

My MegaSTe, used to do this, 2 Bombs. It turned out to be poor filtering on the PSU. I would try a AT PSU and see how you go.

Hi,

1.
I have a Problem, i am looking for the Original Protar Profile HD Driver
Packet.

if anyone here have these Drivers please Email me.

2.
In my Mega ST1 with Pak/3 is also a Graphic Adapter with a Texas Instrument TMS34061 FNL Chip. The Name printed on the Card is :

PROTAR 4ML (B)
ST-Graphikkarte 1.1

There is a VGA-Port out and a port thats looks like a Midiport. I need a Techpaper and the drivers for this Card
please help me.

i already posted in German Newsgroups and searchin Internet for this, but nobody can help me.
if you have any Information please Email me.

cya Timo

p.s.: if anyone need a pic to ident, i can send

>However, you could try with a known good AT PSU for a few hours just to
>check if it really is your PSU that's dying.

I went to the local parts store, and the TT hasn't got anything even

vaguely resembling a standard AT powerconnector. Sure the hard drive
and floppy drive connectors are there, but the mother board connector
has over twice as many pins, arranged in two rows, and using much smaller
pin size. If I had pin diagrams for both connectors, I could make an
adaptor and probably run the TT off an external AT PSU.

Anyway, since the cleaning my TT has been running much longer between
crashes. So long as I can get it to run for at least 4 hours at a
stretch, I won't worry about it.

>Got any docs about that are kicking around? :)

No - I built exactly one (which worked fine using the old TUM_TCP package),
but since I never got around to write proper drivers for the card, I never
did anything on the design - the problem is that the TUM_TCP is not really
useful today due to lots of bugs in the TCP/IP implementation.

>IRQ2.

No. The cascading on the PC is done in hardware, so there really is one
interrupt vector for each ISA interrupt line - the interrupt routine does
not have to poll which device caused the interrupt.

If you need multiple Interrupts, I would strongly suggest using vectored
interrupts - it is quite easy on VME, and you can get a different vector for
each ISA interrupt.

Hi Michael,

>If you need multiple Interrupts, I would strongly suggest using vectored
>interrupts - it is quite easy on VME, and you can get a different vector for
>each ISA interrupt.

I see now. Problem I see is when I set the -IPL lines I would
also have to watch out for the ST Glue. Also, I assume the ST
Glue isn't open collector on these lines. In the Mega ST it
seems better as they used a 8-3 line converter. The only way I
see it possible is to insert a circuit inbetween the Glues -IPL
lines and the CPU -IPL lines.

I understand the vector and auto vector techniques now and I see
that vector would be good here. I can place the IRQ code on
D0-7 (make sure there are no conflicts with the MFP vector
numbers) and each IRQ will have it's own ISR. I was diggin
about TOS 1.62 looking at where each of the CPU vectors point.
The spare ones all point to a dummy rte so I just modify the
supervisor RAM to redirect to my own routines.

I have some sketches on paper of implementing the IRQs but above
problem may require more chips :(

Thanks Michael

Hi John,

I saw you reduced the crashes with a good cleaning. Have you run a virus checker on your hard disk and regularly used floppies recently? its worth a look. also if you have ataris checkdisk3 or diamond edge or one of those sort of utilities use it to see that the hard disk partitions are ok (no bad sectors, odd fat entries and so on) and that the drives are defragmented.

You found a Genius Packet LAN card yet? I have been searching and can not find one. I have two DE-600-e adaptors but they do not work on it (although they should work directly under MINT in the parallel port).

Elliot...

This is really, really weird... My own TT, and every other TT I've seen, have a standard AT powerconnector. Perhaps you're talking about the connector on the PSU? If so, then you've seen an ATX PSU, and not an AT one.

> pin size. If I had pin diagrams for both connectors, I could make an

I've made an ATX->AT adapter for my own TT, using the AT connector(s) from my dead PSU and an ATX connector from an ATX extension cord. It is really easy, you can find the pinouts on http://www.hardwarebook.net/.

Yes, ATX is one block, AT has two blocks.  Don't get the AT
connectors around the wrong way!  I never seen PSU for TT.  ATX
is 2 by 10 pins, At is a single row.

I thought the group might be interested in a monitor problem that arose at the last Cheshunt Computer Club meeting:

One of the memebrs brought along a Falcom with a Dell SVGA LCD flat-screen monitor. This had worked fine on a previous occasion, but when he connected it up this time he only got a self-test colour square floating around the screen when he switched on the Falcon. Luckily there was another Falcon there, with a normal CRT monitor. On that the machine worked fine, while the second Falcon also worked without problems on the LCD monitor.

We tried changing over the adapter leads (Falcon to SVGA) but to no avail. I took a quick look at the connection socket on the Falcon and didn't find anything wrong, but another member eventually spotted that one of the pins of the monitor socket was bent (I thought it was the one at top right, but may be wrong about that). After straightening it, all was well.

Now I am puzzlwed: What does that pin do (it obviously isn't needed with CRT monitors). And how do you trigger the self-test mode on a PC which apparently does use this pin?

Regards, /Peter/

Hmmm - was the pin touching the casing of the socket causing a short?

Hi!

>Now I am puzzlwed: What does that pin do (it obviously isn't
>needed with CRT monitors). And how do you trigger the self-test
>mode on a PC which apparently does use this pin?

The MO pins are bottom right. Two of them, they select which resolution for the Falcon to boot up in to. Hi res, TV mode, RGB and VGA I think. It was probably booting into to a TV mode where the sync rate is around 15KHz. The monitor will not work at this frequency and the modern monitors come up with fancy displays and stuff. I would like to find a LCD screen that does work from 15KHz. At the moment, I'll have to stick to my mutlisync, nice but the radiation is worrying.

I have an old AERCO Ram upgrade for my ST.

It has stopped working, and I can't find the manual for it.

Does anyone have the manual that they can copy and send me?

I'll pay copying and postal costs...

Al

Falcon 030 (DB19)

	Pin	Beschreibung
Red	1	Rot Signal
Green	2	Gr�n Signal
Blue	3	Blau Signal
Mono	4	Monochrome (SM124 only!)
Ground	5	GND f�r Monochrome
Red Ground	6	Rot GND
Green Ground	7	Gr�n GND
Blue Ground	8	Blau GND
Audio	9	Audioausgang 1Vss
Ground	10	AGND (Audio GND)
Ground	11	GND f�r Composit Video
Comp. Video	12	Composit (FBAS)
Hsync	13	HYSNC.
Vsync	14	VSYNC.

Clock	15	Externer Takt
Even_Odd	16	Even/Odd
+12	17	+12 V Steuerspannung
M1	18	Videomode Selekt 1
M0	19	Videomode Selekt 0

Tell me witch pin you mean exactly. I try to describe what he does. Normaly an TFT (LCD) (analog) use exactly the same VGA connector pin out as CRT displays. Falcon do not make any self test on displays.

The one and only checkpoints are pin 18 and 19. While bound this pins to GND user select the video mode of the falcon.

M1	M0	
0	0	ST Monochrome
0	1	ST Color
1	0	VGA
1	1	TV

1 = connected to GND
0 = open n/c

Regards, Robert

Thanks Robert. I had the pinouts in Atari A to Z. Unfortunately I
doin't know which pin was the problem, as I didn't see it -
someone else spotted it and bent it straight.

I realize the Falcon doesn't do self test on displays. This is a
function of the monitor. But something produced by the bent pin
must have triggered it.

>---SNIP---

Yes I knew that too, but couldn't see how that would produce the
self-test. But as Adrian suggested, it may have shorted a pin to
ground and as Lyndon points out, this may have triggered TV mode
which the computer couldn't handle, so went into self test. It
definitely reacted to the Falcon, because the self test only came
up once the Falcon was switched on.

Not, the computer, the monitor. Perhaps it was a typo? Anyway,
I have monitor here that if I force Falcon into a TV/RGB mode a
small box bounces around the screen telling me no video signal
present :) Similar thing, but what did the self test do?

On further reflection, TV mode doesn't solve the riddle. When the
faulty computer was connected to a CRT monitor it came up at
normal resolution (640*480, I think) and not in TV mode!

Regards, /Peter/

I am wondering if my Samsung syncmaster 500s will work with the Atari
ST to VGA cable it seems to fit all the specs except I do no know what
TTL is .My last two Atari Monitors died a couple weeks ago :(
Here are the specs they seem close to what Best Electronics specify on
the website,

Sync :Horizontal 30khz to 55kHZ (auto)
         :Vertical   50 Hz to 120 Hz (auto)

Display color : Unlimited colors

Max Resolution : Horizontal 1024 dots
                         : Vertical 768 lines
Active display : Horizontal 267 + 3mm (10.5" + 0.12")
                       : Vertical 200 + 3 mm (7.87" +0.12")
Input signal Terminated   Analog 0.714 Vpp positive at 75 ohms
Separate Sync TTL Level ,positive or negative
Composite Sync TTL Level ,positive or negative

Also the cable pin out is exactly the same as specified .
It should work with a 3 Atari screen Resolutions no?
Thanks,
Bud atarikid@cox.net

>

>Not, the computer, the monitor. Perhaps it was a typo? Anyway,
>I have monitor here that if I force Falcon into a TV/RGB mode a
>small box bounces around the screen telling me no video signal
>present :) Similar thing, but what did the self test do?

A similar bouncing box with wide white, R, G and B bars but with text indicating something about self test and *not* no video signal.

But as I said elsewhere, the 'faulty' computer worked fine on a CRT monitor and did *not* come up in TV mode, but the usual 640*480 (I think, or even higher). And we tried swapping computers, monitors and even the Falcon->SVGA lead repeatedly, so it was reproducible.

Wish I knew which pin was found to be bent. I thought the guy said it was top right, but that would be Red. Perhaps he meant top left, which is one of the grounds. If this touched the composite pin at bottom left, then as comp presumably isn't used on SVGA it may be used for something else on a PC.

It is the one byte recieve buffer that causes the problems. Setting the software buffers larger works on the falcon, but not the megaste, im

beginning to suspect that theres something different in the mste, but
looking at the squeematics I cant tell. Oh, the 85c30 in these machines is
10mhz.

IIRC, the clock in the order code of the SCC is the *bus* clock, not the
clock used for the baudrate generators, so it may be possible to run a 8MHz

SCC with a 14.xxxMHz brg-clock input without violating the specs.

If the price does not differ much, I would opt for the fastest available version - it will not give faster transmission rates, but you can be sure that it works.

I've created a "flea market" of sorts on yahoo groups. I did this because I got tired of ebay's policies and always getting booted off or my bids not going through. You can visit the "Atari Swap N Shop" at the following url:

http://groups.yahoo.com/group/atariswapnshop

Let me know if this is a good idea or simply a waste of time.

I have come into the possession of an Atari SC1224 color monitor. Being fresh out of Commodore 1084 monitors (they've all died), I was wondering if it was possible to connect the Atari monitor to my Amiga?

I did a little web digging and got some pinouts. Here's what I figured out, but I am not sure how correct this is:

```
Atari ST video connector (13 pin DIN):  Amiga RGB connector (D-23):

  1  AO      Audio Out ------------------
  2  CVIDEO  Composite Video ------------
  3  CS      Clock Select ---------------
  4  MD      Monochrome Detect/Clock In - 15   c1*    (clock out)
  5  AI      Audio In -------------------
  6  G       Green ----------------------  4   green  (analog green)
  7  R       Red ------------------------  3   red    (analog red)
  8  +12V    +12 VDC (520ST has GND) ---- 22   +12v   (+12 volts power)
  9  HSYNC   Horizontal Sync ------------ 11   hsync* (horizontal sync)
10  B       Blue ----------------------  5   blue   (analog blue)
11  MVIDEO  Monochrome Video -----------
12  VSYNC   Vertical Sync -------------- 12   vsync* (vertical sync)
13  GND     Ground --------------------- 16-20 gnd    (ground)
```

Another source I got off the web says that pin 8 is audio ground, so I'm not even sure if I should bother connecting this pin. I'm also not at all sure about the clock lines. Also, were the RGB lines for the Atari analog or digital? Any insight would be appreciated. Thanks!

I apologize ahead of time for this absurdly long post.

Hello all,

After doing a bit of research and IRCing, I decided to come here for a bit more help. My C-Lab Falcon MK-2 with standard atari 14 meg ram board, scsi and ide drives, etc. Has been having odd symptoms since the day I bought it. The symptoms?

1) Earlier version of Groumf Tracker worked fine, latest version will play fine but gives a messed up display. Seems like a programming issue but I am the only one to report this phenomena. Also will display artifacts like something is writing to video memory!

2) under MagiC, TOS, and MiNT, Aniplay while playing mp2 or mp3 (DSP) will get a crackling in the left speaker. Changing some settings can get the crackle to be in the right speaker. Originally I thought turning off DMA transfers would stop it but it doesn't. I also thought Nocrew's mp2 player did not produce crackling but it does too! Even FalcAMP does. Falcamp behaves oddly under MagiC. When I move the mouse fast or do other things, the mp3 playback will actually slow.

3) MagiC runs perfectly... I know right? It's a falcon that runs MagiC fine... but MiNT on the other hand has all sorts of problems. XaAES crashes 5 minutes after starting.. keystrokes are stolen between vconsoles. N.Aes doesn't work much at all and refuses to start in 256 color mode. I have done identical setups under aranym as my falcon. I am not crazy or setting soemthing up wrong, aranym works perfectly, my falcon doesn't. Also under N.Aes tos2win crashes with a bus error when trying to run bash, whereas under Xaaes it will run but will be deathly slow to do anything.

The diagnosis? Well some have suggested bad ram in the DSP, others have suggested bad DMA fix. Taking the DSP problem into mind, it's worth noting that the earlier version of Groumf tracker works PERFECTLY and has never crashed, ALL DEMOS I HAVE EVER TRIED including Hmm have worked perfectly. DSP jpeg decoder works perfectly. DSP effects like echo and reverb work perfectly. AVR playback works perfectly, everything is fine except fscking mp2/mp3 playback. I haev gone over the mp2/mp3's with a fine tooth comb too.. they are good encodings.. they play perfectly on any other machine.

The DMA fix? Well referencing this DMA fix:
http://atari.nvg.org/cpu_accel/

I have found that mine differs severely. The other two resistors near R221 are removed, legs 13 and 12 are not jumpered together. The trace of R216 is NOT cut on mine, and the resistor is gone! The IC that is piggy backed is the right chip and in fact the only identical connection seems to be power and ground.... hrmmf..... maybe clab borked it?

I really care about my falcy and I'd love to be able to use the DSP to it's full potential to decode mp2's at 0% cpu usage, but the evil crackling on bass hits is horrible....

The last thign I must note is that the output gain of the mp2 and mp3 players seems significantly higher than that of groumf tracker and all of the demos which work fine. This audio crackling could be some internal DSP gain setting which is set way high (for mine to handle).

Anyone have any ideas.. should I redo my dma fix to match the one listed and replace the piggy backed IC which appears to have green stuff all over it? (not copper oxidation).. Perhaps wait for the CT60 which might somehow magically fix any and all of my problems? ;)

Any help would be much appreciated!

Thanks
Mark

Hi

I have an ET4000 card which I'm willing to try in an ST. I had a
schematic on paper that I must have printed out some years ago. I've
now lost that paper thinking it wasn't important but now in all the
archives for the ET4000 they don't include any schematic, only the PCB
layout! does anyone have it on there HD? I've tried funet, Vezz and
the original source on some Germany edu server.
Perhaps I get in tough with Torsten Lang?

Thanks in advance

BTW, in theory it would be possible to connect this to the Falcon and
TT right?
And anyone tried adding more video ram to ET4000 chipset, over 1MB?

Lyndon,

I could swear that Vezz had one with schematics, that is if he is running
atarihacks.cjb.net. Did you look closely or am I full of it? ;)

Hi Mark

> I could swear that Vezz had one with schematics, that is if he is running

> atarihacks.cjb.net. Did you look closely or am I full of it? ;)

No, there were no schematics :(I have a feeling it may have come
from Hallvards site but his link isn't working.

Hallo Lyndon!

LA>BTW, in theory it would be possible to connect this to the Falcon

Theoretically, yes. I've been trying to use an ET4000 with my NOVA adaptor in
the Falcon. NVDI was able to detect the card, and I even got the desktop
displayed there. But neither NVDI nor the other driver software was able to
alter the pixel clock rate, so I wasn't able to really use it with decent
resolution and refresh rate.

Well, you have the Nova which I presume is the Nova for Falcon. Nova
came with drivers didn't it? There is also a program in the ET4000
archive for making custom resolutions.

I have what looks like a better translation of the README than
the Ruftrade one.

>I remember downloading this stuff several years
>ago from a German FTP site which is longer around, and I think I
>actually had a hard time finding the files even back then.

Problem is that Thorsten Lang, the author, more or less
disappeared from view. I started translating parts of the manual
but when I couldn't reach him there didn't seem to be much point
continuing as the PCBs came from him.

>I can't seem to find any schematic. At least not as a .IMG or other

>standard graphic file. I did however find several circuit board files
>(.PLT files: "platine"?, and folders with .LJ3 and .LJ6 named "C_MASTER"
>and "CARDEK" which are probably some PCB designing programs).
>Perhaps one of these files contain the schematics?

There is no schematic in the package I have. The *.PLT files can be loaded into and printed from Scooter-PCB, but they are also duplicated (quadruplicated!) as GEM IMG files and as HP-compatible Laser/Inkjet printer files for both 300dpi (*.LJ3) and 600dpi (*.LJ6) resolutions - these print straight from the desktop.

Note that some of the main boards are 4-layer, so difficult for the home constructor.

From the README:
~~~~~~~~~~~~~~~~
After extracting ET4000.TOS *and* ET4000E.TOS you should have the following files inside an ET4000 folder:

README.TXT	Guess what!
MEGA4000/BAU_ES.TXT	German description
MEGA4000/BUILD_IT.TXT (or ENG)	English (shorter) description
MEGA4000/CARDEK/MEGA4000.PLT	PCB for Cardek-like boards with Feature connector, these boards can be placed more distant from the switching PSU) In Scooter-PCB format
MEGA4000/CARDEK/L�TSEITE.IMG	PCB as GEM image file, 300dpi, non-mirrored, solder-side
MEGA4000/CARDEK/L�TSEITE.LJ3	PCB as Laserjet printerfile, 300dpi, non-mirrored, solder-side
MEGA4000/CARDEK/L�TSEITE.LJ6	PCB as Laserjet printerfile, 600dpi, non-mirrored, solder-side
MEGA4000/CARDEK/BSTSEITE.IMG	PCB as GEM image file, 300dpi, mirrored, component-side
MEGA4000/CARDEK/BSTSEITE.LJ3	PCB as Laserjet printerfile, 300dpi, mirrored, component-side
MEGA4000/CARDEK/BSTSEITE.LJ6	PCB as Laserjet printerfile, 600dpi, mirrored, component-side
MEGA4000/CARDEK/BSTPLAN.IMG	Component layout as GEM image file, both sides, 300dpi, top view
MEGA4000/C_MASTER.12+/MEGA4000.PLT	PCB for Color Master 12-type cards (due to the unfortunate position of the RAMDAC these have to be placed closer to the power supply) Scooter-PCB format
MEGA4000/C_MASTER.12+/L�TSEITE.IMG	PCB as GEM image file, 300dpi, non-mirrored, solder-side
MEGA4000/C_MASTER.12+/L�TSEITE.LJ3	PCB as Laserjet printerfile, 300dpi, non-mirrored, solder-side
MEGA4000/C_MASTER.12+/L�TSEITE.LJ6	PCB as Laserjet printerfile, 600dpi, non-mirrored, solder-side
MEGA4000/C_MASTER.12+/BSTSEITE.IMG	PCB as GEM image file, 300dpi, mirrored, component-side
~~~~~~~~~~~~~~~~

MEGA4000/C_MASTER.12+/BSTSEITE.LJ3	PCB as Laserjet printerfile, 300dpi, mirrored, component-side
MEGA4000/C_MASTER.12+/BSTSEITE.LJ6	PCB as Laserjet printerfile, 600dpi, mirrored, component-side
MEGA4000/C_MASTER.12+/BSTPLAN.IMG	Component layout as GEM image file, both sides, 300dpi, top view
ELRAD4K/BAU_ES.TXT	Construction notes (extremely short :-)
ELRAD4K/BUILD_IT.ENG	English version
ELRAD4K/STGAMAIN.PLT	Main PCB layout (4-layer!) in Scooter-PCB format
ELRAD4K/STGAVGA.PLT	ISA PCB layout
HANDBUCH/HANDBUCH.TEX	Dummy file (English & German) to simplify the Tex printout of the manual. The manual itself is still only in German now, sorry! The most interesting part is the appendix with some technical information. I think that's useable also for English reading people.
HANDBUCH/HANDBUCH.DVI	The DVI file... (German only)
HANDBUCH/BLECH.IMG	Image of screening sheet
HANDBUCH/ISA-SLOT.IMG	Image of ISA slot
HANDBUCH/MEGAST.IMG	Image of Megas ST interior
HANDBUCH/STROM.IMG	Image of power connector
HANDBUCH/STUETZE.IMG	Image of support modification
1040ADAP/ET40006.PLT	An adaptor PCB layout for the "small" Ataris, (C) P. Lechtenfeld and kindly made available by him for this archive
1040ADAP/ET40006.TXT	What do you think...
ALT_RAM/MEGA_RAM.PRG	The MEGA4000 as Alternate RAM...
ALT_RAM/MEGA_RAM.TXT	Blubb blubb...
INIT_MOD/STGAIMOD.MOD	Initializing module for the MEGA4000
INIT_MOD/STGAIMOD.TXT	Some copyright stuff...
MEGAWVBL/MEGAWVBL.PRG	WVBL routine for the MEGA4000
MEGAWVBL/MEGAWVBL.TXT	Guess what it is...
VMG4000/VMG-4000.PRG	Videomode generator version 1.12
VMG4000/VMG-4000.RSC	Resource file for it
VMG4000/VMG-4000.CFG	Config. file for MEGA4000 with Cardek TC ET4000 card
VMG4000/VMG-4000.TXT	Manual for the VMG, imperative you read this!
VMG4000/VMG-ENGL.RSC	English resource file
VMG4000/VMG-ENGL.TXT	English manual
VMG4000/HISTORY.TXT	
VMG4000/SVGA.INF	Info file with some standard resolutions

~~~~~~~~~~~~~~~~~~~
Hope that helps!

Regards, /Peter/

:   I have come into the possession of an Atari SC1224 color monitor.
:   Being fresh out of Commodore 1084 monitors (they've all died), I was
: wondering if it was possible to connect the Atari monitor to my Amiga?

:   I did a little web digging and got some pinouts. Here's what I
: figured out, but I am not sure how correct this is:

: Atari ST video connector (13 pin DIN): Amiga RGB connector (D-23):

:   1 AO   Audio Out ------------------

This is where you connect your Amiga stereo leads.

:   2 CVIDEO Composite Video ------------

The Amiga 2000 (possibly not the C or D models) has only got monochrome
composite video, unless you use an RF modulator. Leave this pin be.

:   3 CS   Clock Select ---------------

Leave be.

```
:   4  MD      Monochrome Detect/Clock In - 15   c1*    (clock out)
```

Leave mono detect be. An Atari mono monitor will ground that pin, but it is useless in our case, and probably not even connected. Also, leave the clock signals be, they're for genlocks and other special requirements.

```
:   5  AI      Audio In -------------------
```

Leave be.

```
:   6  G       Green ----------------------  4   green  (analog green)
:   7  R       Red ------------------------  3   red    (analog red)
```

Right.

```
:   8  +12V    +12 VDC (520ST has GND) ---- 22   +12v   (+12 volts power)
```

Not sure what this is for.

```
:   9  HSYNC   Horizontal Sync ------------ 11   hsync* (horizontal sync)
: 10  B       Blue -----------------------  5   blue   (analog blue)
```

Right.

```
: 11  MVIDEO  Monochrome Video -----------
```

Not relevant for the SC1224.

```
: 12  VSYNC   Vertical Sync -------------- 12   vsync* (vertical sync)
```

Right.

```
: 13  GND     Ground --------------------- 16-20 gnd    (ground)
```

Aren't there several kinds of ground on the Amiga video connector?
Someone?

:   Another source I got off the web says that pin 8 is audio ground,
: so I'm not even sure if I should bother connecting this pin. I'm also
: not at all sure about the clock lines. Also, were the RGB lines for
: the Atari analog or digital?

The Atari monitors were analogue.

I was wondering, since the sync lines on the Amiga RGB pinout diagram had an asterisk by them if I did not need to run those lines through an inverter before I sent them to the Atari monitor?

```

> Someone?

The Amiga RGB port pinout diagram I have does note a ground return line for the clock signal on pin 13. Otherwise, lines 16 through 20 are simply labeled 'ground'.

Also, I guess there would be no point in connecting the +12 volt line. Unless the Atari monitor required it for something? I wouldn't know what.

FWIW and IIRC Peter West translated some if not all of the text files for the ET4000 project. Maybe he'll pop up and expand on this a little?

Cheers

Hallo Lyndon!

LA>Well, you have the Nova which I presume is the Nova for Falcon.

right. Well, just the adaptor, no mach64 for it (yet). mach32 won't work at all.

LA>Nova came with drivers didn't it? There is also a program in the
LA>ET4000 archive for making custom resolutions.

I know. That's the "other software" I mentioned in my previous post. With both this software and the one from NVDI, I can create different screen resolutions. But this is of no use, as it's just impossible to set the pixel frequency. So I'm stuck with 640x480@60Hz, which is unusable (at least not better than the falcon can display on it's own).

I have an ST with only four of the RAM slots populated, (U3, U4, U5 and U6), U10, U11, U12 and U13 are unpopulated. I am trying to do the RAM upgrade outlined at the site http://atarihacks.cjb.net/, which uses two 1 meg simms. Unfortunately it refers to two banks of eight, I only have two banks of four. The motherboard number is C103175.

Any ideas how to upgrade. What would happen if I used a 4 meg simm instead (30 pin) how would I disable the RAM on the motherboard and only use the one piece 4 meg simm?

Anyone want to tackle this one ? :)

Hmm, is this ST got only 256k of RAM?

You can use a 72 pin simm, 4Mb. Use a socket, it's a must. You must
only use FPM ram and symetrical. Look at atari.nvg.org for the Stacy
upgrade, same rules apply for ST really. Worked for me.

Indeed, I've been talking to him by email for the last few days. He
said the schematic was not for the package, I don't know where I got
my schematic from then. Anyway, I reverse engineered the Cardek
adaptor board and did the Same for the GALs. Infact it seems pretty
straight forward, memory mapped device. The thing that Torsten made
clear was that timing can be problematic. I'll be giving it a go
sometime as I usally don't spend hours writing down net lists of
boards for nothing :) I'll try optimising some other parts as well,

```
like the GAL equations.

I think you're right, it only has 256k

How do I disable it and use the 4 meg simm?

I checked the chips and they are 256x4 bit and not 256x1 bit

Strange eh?

But still, how do I disable them and hook up the 4 meg simm?

Thanks

Elmar Hilgart still sells a ready-made and CT2-friendly ROM port adaptor
for these ethernet adaptors at 25 Euros plus 10 Euros postage. I've just
bought one from him.

No. 30-pin SIMMs are only 8 bits, you need two of them for the 16-bit data bus - and the ST can't use 4MB 30-pin SIMMs since one bank is limited to 2 MB.

You can use a (right) 4MB PS/2 SIMM, which is 32 bits, but can be used as two banks of 16 bits, which is perfect for a ST.

cu

I missed the last part of your post 'Did you see the'

And yes, there are four chips in the bank and four empty just to the right.
What is interesting is that the TOS chips are dated 1985 and there are two
of them.

Awaiting your reply on how to disable the first bank ;)

Ok, I managed to find two thirty pin 1 meg simms. Now, about the ST only
having 4 memory chips (256x4) which I assume makes 512k, since it is a 520ST
with internal p/s etc. All other ST's I have seen have 16 chips for 512k,
but this one only has four, with four vacant slots to the right. How would
you recommend this upgrade?

Greetings,

I've recently been trying to set up another TT030 from the parts that I have, and have been experiencing unexplained crashes. Unfortunately, I don't know what could be causing this, as the problems seem to occur with each STram board, TTram board, and motherboard that I try. It occurs with a clean boot, or when booting from floppy. The crashes seem random, but happen much, much too frequently for any Atari computer - if this was Windows I would attribute the problems to a corrupted OS installation.

In any case, I would greatly appreciate any recommendations as to software that I might be able to use to diagnose the problems. I don't know if the TT030 diagnostic cart would be of use in this situation, or if there are other Stram and TTram tests that I should seek out.

Any help would be greatly appreciated.

John Perez

Any kind of PC 1.44Mb you can change ID on. I have used Sony-drives
myself.

Have you tried another PSU? Poor powersupply can cause all sorts of
subtle, weird things.

Hi Brent,

>Awaiting your reply on how to disable the first bank ;)

Did you see Jo's site on kooking a simm upto an Atari?
Anyway, I'm back on Okami now so there should be no cut off
posts :) To disbale the old RAM it is possible to just disable
the RAS and CAS lines from the RAM and MMU and pull the RAS/CAS
lines to Vcc (5v), on the RAM side of the cut. I convienient
place is the 3 resistors (6 if you have a 1040st). They're

```
68 ohm IIRC.  There should be 33 ohm near them, these are the
MAD lines.  The Marpet disabled RAM this way.

Hi Brent,

>Ok, I managed to find two thirty pin 1 meg simms.  Now, about the ST only
>having 4 memory chips (256x4) which I assume makes 512k, since it is a 520ST
>with internal p/s etc.  All other ST's I have seen have 16 chips for 512k,
>but this one only has four, with four vacant slots to the right.  How would
>you recommend this upgrade?

You are right, all the STs I've seen had 16 chips, 256k*1.
anyway, see my other post.  Use a 72 pin simm, get all 4MBs
while you're at it.  I had no end of troubles doing this some
months ago until it appeared I had two higher address lines on
the CPU bridged with a whisker of solder.  Please, use plenty of
ground wires and use a socket for your simm!!

I downloaded the file for doing the parity mod to the Link, but not
being an EE, need a little advice. I "assume" that the connections
must be made between the male and female connector, ie, lifting some
pins say on the harddisk to solder the 280 inline to the controller.
Are there any free pins on the ASCI/DMA connector off the ST that
could be used to route 5 volts through? Only one I see is pin 16 "A1"
that is not identifiable to me. If that was possible, the 280 could be
mounted inside the link. What about getting rid of one of the grounds?
TIA,
Mike

Hi Brent,

>No, I did not se Jo's site, what is it again?

http://atari.nvg.org I think.

>Wow, I'm a little lost....so could you explain the disable again.

Attach the RAMs RAS and CAS wires to 5v supply.

Hello everyone,

I wonder if it is possible to read 5"1/4 disks (Atari ST formatted) on a PC
with a 5"1/4 drive?
(sorry if this question has already been asked here many times...). I
received some mails from people with such disks, but I can't help them since
I never got any 5"1/4 disks on ST.

Thanks in advance for any answer.
Cheers,

Brume.

Hello,

Someone would have him of infos on differences between the RSC files of type 4 (AES 3.40 and more) and those generated by Interface. Indeed for one same RSC file, the size is bigger when it is generated by Interface 2.33. This is not true that at the time of the utilization of icons color. I perceived of it at the time of the debug of my version 1.3 of Icon Extract. At the time of a safeguard of two icons windows in 256 color, I generated a pure RSC file of type 4. In fashion TRUE COLOR, Interface 2.33 displays him to me of it false colors whereas RSM displays him to me correctly ! I did a to copy - paste to create therefore on Interface a similar and there surprised file, there are more 1500 bytes of difference! Thank you by advance of your help.

Florent

Ive never seen anybody use a 5.25 drive on an ST. There was no need because
the 3.5's were larger capacity and more easily available.
I think perhaps you are talking about 8bit atari. That _did_ use 5.25 disks.

There was a 5.25" Drive for the Atari ST, the PC551 Drive.
But this was intended only for Data Transfer between
PCs and Atari ST in the early days! As far as I know this
used a special software and you could not format a 5.25"
disk in ST format.

That depends on what you mean by "ST Formated". If they are really PC format
but with
the duff header then the Gem Explorer thing that you can get from
emulators.org or or even
GEMULATOR itself should be able to read them when DOS file is turned off.

However if they have extra tracks or sectors I would expect they can't be
read
except on an ST, and then if only if the new drive had the same capabilities
as the original.
I say that because it was common practise to write as many sectors and
tracks as your drive
would support. Due to slight differences in drives you may find you can't
read the stuff...

I have an IB Drive. It's nice to use with PC Ditto. Most DOS software
of the time came on 5 1/4" disk. I just found a complete set of DR DOS
and GEM in an old box:) They were actually quite popular, with several
formatting utilites available and drive step setting software.

Mike

P.S. If Crowbar1924@aol.com reads this, I still have the drive you bid
on and won on Ebay. After you failed to pay, I decided it was a nice
drive to keep, thus the reason you didn't get any negitive feedback.

Ok, figured it out. The data sheet pretty much tells the whole story.
How does the Link get power for the Mach chip? Does it pull a TTL
level from somewhere and amplify it?

DOES ANYONE KNOW HOW TO MAKE FLOPPYS SPIN IF THEY APPEAR HARD TO TURN? I'VE A LOT OF WORK ON THEM AND NEED IT - IS IT THAT OLDER 520ST's DISC DRIVES GET "TIRED" AND CAN'T TURN DISCS PROPERLY? IS THERE A WAY TO TAKE OUT THE OLD FLOPPY AND PUT THEM INTO A NEW 3 1/2 INCH CASE SUCCESSFULLY?

You'll probably find that there's something in the disc that's making it harder to turn. If this is the case, you can try very carefully splitting the case with a very sharp knife and _very carefully_ removing the floppy, blowing out any dust and other accumulated rubbish from in the case and then re-inserting the floppy.

If you're lucky the case will split easily with no, or very little, damage to the floppy case. This is good because then you don't need to "rehouse" the disc in another case.

Once the disc is re-inserted into the case, you'll need something to hold the case together again. I used disc labels as a temporary fix while making sure the disc worked. If it did work, I used some plastic cement/glue carefully applied to seal the disc case, with another label stuck over the top just to make sure.

PS. Please don't post in upper case. It's harder to read and considered to be shouting, and rude, in newsgroups/emails.

Regards,
  David Bolt

Sometimes the metal shutter that covers the opening on the floppys gets "crimped" so it's hard for the drive to open it.

If you can carefully bend it out a little to let the shutter slide easier it may help.

Otherwise you may have to CAREFULLY remove the shutter completely.

This may let you insert the disk and successfully read it.

If the disk still turns hard, try David's advice about splitting the plastic case and cleaning it.

In any case, once you can read the disk again, be CERTAIN to IMMEDIATELY COPY THE DISK TO A NEW FLOPPY.

Don't try to continue using the "bad" disk- that's just asking to lose your data permanently.

BobR

Hi!

Where can i read more about:
- changing the original SCC to ESCC
- differences between version of SCC upgrades if any
- Connecting the Modem1 Port in Falcon

Any doc's/WWW ?

Hi,

All info required is in the DoitF030 archives by Robert Shaffner.
These are truly great hardware docs for the falcon, it covers all the chips,

all connectors, and lots of add ons.

/Peter

I updated my page about Eiffel, a PS/2 interface for Atari.
This update is about the firmware, which fix a problem with
mouse and keyboard timing synchronisations.

I added the RESET command support, to swicth off the CAPS lock
indicator if the Atari is rebooting.

Thank you to you both, I'll have a go when I pluck up enough courage to try splitting a disc - my problems then start, as I then want to transfer the text on it/them to PC format. Good luck me!!

P.S. Sorry for "shouting"!

Proof of payment. He wants to give you Barrie wants to give you 60%
discount because ... i don't know why... and you need to have the proof,
because what? Because you don't believe him? I cannot understand ...
sending money is also illegal here in Poland, but I allways do it like
this if i Have no possibility to pay by card, and NEVER has any problems
with this (the delivery problems not with law what is silly to be afraid
bout IMO).

So you wouldn't mind if I stole your Ataris then? ;-)

>    Proof of payment. He wants to give you Barrie wants to give you 60%

I didn't mean Barrie in particular, I *always* prefer to have a proof of
payment.

> discount because ... i don't know why... and you need to have the proof,
> because what? Because you don't believe him? I cannot understand ...

I've been ripped off several times. No, not by Barrie, but by some other
rather well-known Atari dealers.

> sending money is also illegal here in Poland, but I allways do it like
> this if i Have no possibility to pay by card, and NEVER has any problems
> with this (the delivery problems not with law what is silly to be afraid
> bout IMO).

Do you know *why* it's illegal? It's because sending cash in the mail is
an open invitation to criminals, e.g. dishonest employees that opens
letters that looks like they contain cash. Since they just throw away the
evidence (it doesn't matter if there's cash in the envelope or not,
they've opened it and it now has to "disappear".) this means that a lot
more mail will never be delivered too.

The simple solution to this is to use registered or insured mail
depending on how much money you send.

I have used this a lot of times with from a couple of SEK 100 inside upto
rather large packages full of bank notes. Perfectly legal, secure and not
too expensive. (And no, those large packages were not my own money...)

Ahh, but you see, this costs pretty much the same as just transfering the
money directly to the seller's bank account...

Registered mail is not expensive at all here in Sweden. Just go to the
nearest foreign exchange and buy some money in whatever currency you need.

Will by much less compared to US$ 20. Perhaps around 5 at the most.

Hi,

I have an Atari SH024 hard drive unit, but no cable to connect it to my STE.
Does anyone know where I can get one? (in the UK) and for how much?

Thanks,

-Bill.

I ask my bank to transfer the money directly to the recipients bank
account (if possible). Except from sending cash in the mail, this is the
cheapest method for me.

NOK40-60, it probably depends on the bank and to where the money is transfered. But often the receiving bank also charges a fee, so some times you'll have to double this.

>I need and where to get??

NVDI, Speedo GDOS or Atari's GDOS. The first two are commercial, but only the first is still available AFAIK. It's the best solution really.

You can also get the DIABLO emulator and an Epson 8 pin printer emulator called LaserBrain. I think that these are available for download on ftp servers.

http://www.google.com will be your friend to find these I think.

I've now installed an Atari FontGDOS driver for slm Printers.
But I don't know how to use it :-(
Which software programs use the gdos printer drivers?

What's DIABLO? It was mentioned several times but I don't know it.
Asking a real
atarian didn't help....

That problem solved, I hope. Yesterday, I zipped up the latest

Diablo emulator, v 1.6, that runs under MiNT, and copies of every laser font I had, and put them in incoming at chapelie.rma.ac.be, to be moved to untilites/printers, eventually. If they do not work, I need to fix that. They should work. I copied them from my hard drive, and they work there.

Some of those fonts are hard to find, and are necessary, if you use a spreadsheet or data base program that needs to print out in a compressed font to fit on a page.

Than I'll kill you! ;-) It will also be illegal but as I know I will do
everything for my ATARI ;-D

>>   Proof of payment. He wants to give you Barrie wants to give you 60%
> I didn't mean Barrie in particular, I *always* prefer to have a proof of
> payment.

I prefer also, but If I want to buy something abroad, and it costs e.g.
50Euro, I will probably send it in enveloppe, because International
money transfer cost me about 30euros, so it doesn't have sense to me...

>>discount because ... i don't know why... and you need to have the proof,
>>because what? Because you don't believe him? I cannot understand ...
> I've been ripped off several times. No, not by Barrie, but by some other
> rather well-known Atari dealers.

Probably I don't understand you because, my english ... but if they are
ripped off you ... IMO it means they get more money for something than
it's value, so than what the proof of payment can help you this case? ;-)

> Do you know *why* it's illegal? It's because sending cash in the mail is
> an open invitation to criminals, e.g. dishonest employees that opens

It is illegal (IMO) because if i send you 100$ by mail, and you will get
it, the tax departament will not know about this... IMO it is why the
sending money by snail mail is illegal.

O.k. we are very Off topic here so EOT

I'm having some weird problems with the internal HD (42MB Conner) of my
Stacy 4.
In the past, I had some problems booting from that disk, because (my
fault) I installed two different HD drivers on it (Atari's AHDI and ICD
driver). As I wanted to save the data written on that HD, I disassembled
the Stacy (a daunting task), and put that disk on an ICD external box
with DME-SCSI interface, connected to a Mega STE 4. I successfully made
the back-up of all the data of the Stacy's HD and then I reformatted it
with Atari AHDI.
Unfortunately, when I put the HD back inside the Stacy, it is not
recognized anymore by the computer. Even running ICD's "ID Check"
doesn't show any unit connected.
Putting the same disk on the ICD SCSI box, it works. Putting it inside
the Mega STE, it does not, as it happens inside the Stacy.
When I put the Mega STE 48MB HD inside the Stacy (too big to close the
lid), that disk works, so Stacy's SCSI interface works.
I have tried to change the SCSI ID of the 42MB Conner disk, and to add
the three small 8-pin terminators (taking them from Mega STE's HD), but
it still doesn't work.
I've also tried to put a Quantum 80MB SCSI drive inside the Stacy, but -
again - it is not recognized.

Does anybody have a suggestion to make that ��%�@ Conner HD (or any
other SCSI HD that could fit) working again inside my Stacy?

Thanks for your help!

I think you have some other problem, and I do not know what it is either. When you install AHDI, it writes a jump instruction in the boot sector of the disk (or partition) to instruct the computer to run the something.sys program in the root of the drive.

When you install ICD on it, it overwrites the jump instruction. There is really no such thing as installing two different HD drivers at the same time.

I think you need a new drive. One way to check, usually, is turn the drive over, and see if it works better that way. What usually fails is the spindle bearing, and it develops friction and drag, which interfere most with acceleration, and cause write errors. And then again maybe not.

And, I suspect, the ICD box SCSI design may be more tolerant of speed problems than the Atari SCSI design is.

So, turn it upside down, install a driver program, and see if it boots.

No, I do not have a Stacey, admire your technical skills in getting into one, and do not know where to find a new drive for it.

Try Best Electronics.

Jim

That won�t work correct :)
One driver is enough.

AHDI or HDDriver should work fine to any Atari.
ICD drivers are not ready to used by an STACY. Never hear this before.

> Unfortunately, when I put the HD back inside the Stacy, it is not
> recognized anymore by the computer. Even running ICD's "ID Check"

STACY HD controller needs his SCSI device on SCSI ID 0 and Parity OFF.
Watch SCSI termination.

> doesn't show any unit connected.
> Putting the same disk on the ICD SCSI box, it works. Putting it inside
> the Mega STE, it does not, as it happens inside the Stacy.

MSTe and STACY used both the same bullshit of Atari HD controller.

ID 0, Parity OFF, termination. Three points you should have an eye on.

Regards, Robert

Hi!

Has anyone considered getting MAME to run on a Falcon with the CT060? I would consider an 80MHz '060 much better than my P166 that I used to run MAME32, and only 32MB system memory. With my old PC, I was able to run aracde games from 1984 and below.

This would be a very neat app! It could be run in TOS too! And, with the RGB out of the Falcon!

Jim

>I've now installed an Atari FontGDOS driver for slm Printers.
>But I don't know how to use it :-(

I can't remember what you have to do to install GDOS, but you should have all the fonts you have installed several times listed in ASSING.SYS under lines like this:

01p SCREEN.SYS

and so on.

The corresponding printer fonts will be listed under an entry at the end of the file under 21 (LASER.SYS or something like that).

Then when you use an app like Kandinsky (a vector art prog), AtariWorks (DTP/Database), Papyrus (Word processor) and loads more, you'll be able to work with the screen fonts as you type and the corresponding printer fonts will be used when you print - the printer dialog should allow you to choose the device number of the printer from ASSIGN.SYS (21 is normal). That gives you WYSIWYG, but you'll only get good results if you have fonts in the point sizes that you want to use. SpeedoGDOS and NVDI both use vector fonts so you can freely size them without loss of quality.

>> You can also get the DIABLO emulator

>What's DIABLO? It was mentioned several times but I don't know it.

It's a very old printer standard - it can be used to print text from the desktop for instance, or text from any prog that doesn't have GDOS or a specific SLM printer driver.

>Asking a real
>atarian didn't help....

Comp.sys.atari is your friend...

That's about the best I can do for you I think - I use NVDI exclusively.

Yep,
try this:
install the HD, boot up the Stacy with the Atari AHDI-disk in the drive.
Make a new drive C-icon using the dropdown menu's.
Use INSTALL program from the disk to install a bootable HD-partition.
This should normally (but what is normal these days??) work.
Success!

Stef

> Has anyone considered getting MAME to run on a Falcon with the CT060? I

I compiled the SDL version of xmame (the binary is 13MB long, BTW). Unfortunatelly It throws only some error when executed. I�m going to compile it again with the newer version of SDL.

> would consider an 80MHz '060 much better than my P166 that I used to run

I�m not sure. The raw 68060 power is probably much lower than the P166 one. In addition there is fast accelerated graphics and lowlevel optimisations on the PC side.

I compiled several emulators of various machines (genesis/nes/snes/gameboy/c64) and they are simply unusable on a 68040 machine with graphics card. Only the C64 works on about 50% speed of original machine with sound disabled, so it should be fast enough on a 68060.

Ctirad

Spain, 24 June 2001.

The following text describe techniques to do continuous hardware scroll with STe and FALCON machines. This technique make the scroll in very little time.

With continuous I mean, scroll like to XENON or IMPOSSAMOLE but fine.

Is very possible that ZOOL and ENCHANTED LAND uses such techniques.

You must know how make normal hardware scroll (you must know exactly how control $FF820F and $FF8265 registers), ok?.

To make horizontal scroll one pixel for every VBL at the left direction, make the following passes:

1) Define two contiguous screens (320X200 and 320X200)
   ($FF820F=80)

```
   0                         319 |0                          319
   ------------------------------|------------------------------
0  |                             |                             |
   |                             |                             |
   |           main              |          secondary          |
   |                             |                             |
   |          screen             |           screen            |
   |                             |                             |
   |                             |                             |
   |                             |                             |
199------------------------------|------------------------------
```

2) Now you must write some graphics at right border in secondary
   screen. 16 bit wide for example:

```
0                         319 |0     15                   319
------------------------------|------------------------------
```

```
|                             |       |                     |
|                             | extra |                     |
|                             |       |                     |
|                             |graphic|                     |
|                             |       |                     |
|                             |       |                     |
|                             |       |                     |
|                             |       |                     |
------------------------------|------------------------------
^----current visible window---^
```

3) On the first VBL it's necessary to scroll one pixel ($FF8265=1)
4) On the second VBL it's necessary to scroll another pixel ($FF8265=2)
5) On the thirt VBL it's necessary to scroll another pixel ($FF8265=3)
6) On the fourth VBL it's necessary to scroll another pixel ($FF8265=4)
7) On the fifth VBL it's necessary to scroll another pixel ($FF8265=5)
8) On the sixth VBL it's necessary to scroll another pixel ($FF8265=6)
9) On the seventh VBL it's necessary to scroll another pixel ($FF8265=7)
10) On the eighth VBL it's necessary to scroll another pixel ($FF8265=8)
11) On the ninth VBL it's necessary to scroll another pixel ($FF8265=9)
12) On the tenth VBL it's necessary to scroll another pixel ($FF8265=10)
13) On the 11 VBL it's necessary to scroll another pixel ($FF8265=11)
14) On the 12 VBL it's necessary to scroll another pixel ($FF8265=12)
15) On the 13 VBL it's necessary to scroll another pixel ($FF8265=13)
16) On the 14 VBL it's necessary to scroll another pixel ($FF8265=14)
17) On the 15 VBL it's necessary to scroll another pixel ($FF8265=15)
18) On the 16 VBL, add 8 bytes (four planes) to main screen pointers ($FF8205,7 and 9), set $FF820F to 80 and $FF8265 to 0.

19) Now it's necessary copy the 1600 bytes (8 bytes for every plane * 200 lines=1600 bytes) of the new graphics zone to old graphics zone screen (the left zone):

```
    |<<<<<copy byte here<<<<<<<<<<|
    |                             |
0     15                  319 |0     15                   319
------------------------------|------------------------------
|      |                      |       |                     |
|      |                      |       |                     |
| old  |                      | new   |                     |
|      |                      |       |                     |
| zone |                      |graphic|                     |
|      |                      |       |                     |
|screen|                      |       |                     |
|      |                      |       |                     |
------------------------------|------------------------------
       ^----current visible window----^
```

Now you must write another extra graphics on secondary screen, into bits 16 to 31 of every line.

```
0     15                   319 |0     15      31           319
------------------------------|------------------------------
|      |                      |       |  new  |             |
|      |                      |       |       |             |
| old  |                      |       | extra |             |
|      |                      |       |       |             |
| zone |                      |       |graphic|             |
|      |                      |       |       |             |
|screen|                      |       |       |             |
|      |                      |       |       |             |
------------------------------|------------------------------
       ^-----current visible window---^
```

Now control $FF8265 register in order to repeating pass 3 to 18 and another time more, copy new graphics zone to old graphics zone (pass 19):

```
           |<<<<<copy byte here<<<<<<<<<<|
           |                             |
0     15      31           319 |0     15      31           319
------------------------------|------------------------------
|      |       |              |       |  new  |             |
|      |       |              |       |       |             |
|      | old   |              |       | extra |             |
|      |       |              |       |       |             |
|      |graphic|              |       |graphic|             |
|      |       |              |       |       |             |
|      | zone  |              |       |       |             |
|      |       |              |       |       |             |
------------------------------|------------------------------
               ^----current visible window----^
```

The process is repeated until when the current visible window is the secondary window and the main screen is a copy of the secondary screen:

```
0                         319 |0                         319
------------------------------|------------------------------
|                             |                             |
|   main screen is exactly    |     secondary screen is     |
|                             |                             |
|    like to the secondary    |   exactly like to main      |
|                             |                             |
|           screen            |           screen            |
|                             |                             |
|                             |                             |
------------------------------|------------------------------
                              ^----current visible window---^
```

At this point, you must set the main screen pointers (FF8205,7 and 9) to point to the main screen (another time more):

```
0                         319 |0                         319
------------------------------|------------------------------
|                             |                             |
|                             |                             |
|                             |                             |
|                             |                             |
|                             |                             |
|                             |                             |
|                             |                             |
|                             |                             |
------------------------------|------------------------------
^----current visible window---^
```

how you see, only 1600 bytes is copied every 16 VBL.

If the scroll is at two pixel (more speed) for every VBL, you must copy 1600 bytes every 8 VBL etc.

ok?

this is very easy!!

no?

Do you imagine how make the vertical scroll?.

First you must make two screen one above the other one.
Second you now must copy 160 bytes every VBL from "the new line" to "the old line".

Mixing the above techniques make possible multi-directional (8 directions) scrolling.

be fun!!

Miguel Garc�a

I think you just put FONTGDOS in the AUTO folder of the boot drive.

If this doesn't work, get back to me - I've got the full FONGDOS installation sitting here somewhere...

Hi!

Which one is correct Zilog ESCC Chip for Falcon??? Is the SCC -> ESCC change only what i have to do, or maby the change of the chip is only piece of work?

Falcon SCC only can be modified with Z8530, Am85C30 or an Z85230 chip.
Other won't work!

Well?

*All* the chips he listed are Z85230, only in different versions.

The Falcon needs the PLCC version, so that rules out about half of them -
however, I am not quite sure about the other variants (it looks like two
PLCC variants in different speed grades). Maybe the data sheet can tell
more.

cu
Michael

> Why you want to change the SCC chip ???

Mostly because it's possible ;-) It should be faster, and will have larger buffer. The SCC can work with 115200 but it won't work very well ... especially if the comp. is not 100% free to manage the port. So if I can change it to faster i want to do this ... but i have to know which chip is correct ... and I don't know this :(

Hi!

Dnia 02-03-11 20:25, niejaki Michael Schwingen usiad� przed komputerem i napisa�:

>>Falcon SCC only can be modified with Z8530, Am85C30 or an Z85230 chip.
>>Other won't work!
> Well?
>
> *All* the chips he listed are Z85230, only in different versions.
>
> The Falcon needs the PLCC version, so that rules out about half of them -
> however, I am not quite sure about the other variants (it looks like two
> PLCC variants in different speed grades). Maybe the data sheet can tell
> more.

So now the list is shorter ;-) I can download the description, but it will not help, me because I don't know where should I look, to be _SURE_ that one of this 7 PLCC chips is correct one.

Professionally Recycled Motorola 68060 Processors

We have acquired another stock of perfect condition FULL 060 processors.

Here are the details:

Motorola 68060/50MHz Processor
-FULL Version including MMU (memory management unit) and FPU (math coprocessor)
-Professionally recycled
-Full refund/replacement guarantee
-Perfect for Amiga 68060 and Atari accelerator cards (Phase5, DCE, GVP-m, Apollo, QuikPak, DKB, etc.)
-Ideal for the upcoming Falcon CT60 board, as well as Milan, and Hades (Medusa) systems
-Well suited for overclocking

Price: $105/each
Quantity discounts available

E-mail us at vernalelm@NOSPAM.yahoo.com

Remember to remove the NOSPAM. after the @ sign from the address before sending a message. Mail server should be just "yahoo.com".

You can save a lot of money by buying your 060 accelerator board or system without the CPU and installing one of these. We are a trusted source for quality processors, with many customers within the Atari marketplace, including Czuba Tech.

If you're not familiar with the recycling process, many companies specialize in chip recycling. They have machinery which safely removes these chips from the sockets of working boards. They are then sold in bulk to distributors and OEM manufacturers. Their lower cost makes them available for products (such as Amiga and Atari boards) where the list price of over $500 for small quantities of new 68060 processors is not possible.

Semiconductors tend to last a lifetime, so these products are regarded as new quality. You will receive the same performance as that of a new processor. They are fully tested at the recycler before packaging, and we guarantee them individually with a refund/replacement guarantee.

Feel free to ask us any questions you may have.

Thanks!

Any of the PLCC ones will work. The last two numbers are clock speed in Mhz. I think the Falcons SCC is clocked at 6mhz ?? IIRC. One peep at the sqeematic I will know for sure. The SCC in the Falcon is not socketed, so you will have to very carefully desolder it from the mobo. If you are not already using hsmodem7 then you should get this.

BTW, I need to replace the SCC in my MegaSte, I ordered an ESCC from RS components, but they sent me some CIO chip instead. Bastards. If you know where to get an ESCC chip from I would be grateful - My MegaSte can only recieve at 56k, and thats not without dropped packets, but transmits beautifully at 230k to my PC. (Hence it is the recieve buffer that is causing the problems).

Jakub Klawiter <wariat@klub.chip.pl> wrote:

> So now the list is shorter ;-) I can download the description, but it

Yes. What kind of chip do you found in your falcon? :)
What i have postet they all works fine.

I can�t knew witch version is avaiable on many places of this smal
planet. Sorry.

I�m sure you need an chip carrier to fit you new chip :/

> that one of this 7 PLCC chips is correct one.

I posted three different releases of an ESCC as PLCC.
That what i know it work best, so god will..

You should ask you local electronics distribution for PLCC and Carrier.

Some other words: :)

Do not think you got more as you have after replace this chip..
An Falcon isn�t an object of high performace ;)

Regards, Robert

Farnell in the UK have the AMD version of the Zilog SCC. For the
Falcon he does need PLCC, the last digits being the Speed in MHz. I
think the speed of the SCC in Falcon was somewhere between 10 to
14MHz. I'm not sure if putting a newer one in is going to speed it
up, did they increase the buffer size with the newer ones? I thought

it was the interupts that caused the problems, too many for the CPU to
handle. You can set up software buffers in HSModem by dropping the
scc.prg onto setter.ttp.

: scc.prg onto setter.ttp.

From the data sheets, the original has a one-byte buffer, and the
upgrade has a four-byte buffer. Should cut the number of interrupts.
I have the proper chips and carriers, and will someday get around
to installing them in a machine I really do not need right now.

None of my hardware has failed with the exception of the floppy drive, so you may want to get a floppy. I'm not sure if this is common, but it seems that it would be (moving parts and all). Of course it never hurts to have extra Atari around!

Simple, buy a replacement socket from Tandy or any other electronics store. Then carefully remove the keyboard from the ST cas. Turn it upside down and remove all the screws. Try not to drop any kes and keep an eye on where the cops were, then desolder the dodgey port and solder in the new one. All that remains is to put it back together.

Mark

(i come from the world of pcs so please forgive me if i make some awful asumptions ;-)

how does the atari boot ?

is its OS code kept all in rom, or does the rom load the os from a floppy?

linux works on the atari right?

how does linux boot on the atari so that it can take over the machine?

how would i go about making an atari boot my own code from, say, a floppy disk?
the reason i ask is since i am working on a hobby os, mostly for the PC, but i want to make it easily portable, so i intend to also write a basic functionality to boot on different architecture (M68k processor with MMU).

any links or books?

Ta,
Ben

Hi,

The atari ST has its bootstrap, BIOS, and GUI in ROM (well any atari ST after ~1986)

No floppy disk is needed to boot to the desktop, though if there is no hard drive, a blank floppy in the drive will speed up the boot process considerably.

Linux is not available for the basic ST (something does exist but I nothing "mainstream" i think).

If you write a program that runs under 68K then compile it and place it on the floppy in a folder called "AUTO". When the system boots it will run this program first. Other than that, you can put code in the bootsector of the floppy, and make the checksum of the sector $1234. This will boot earlier in the startup sequence than the auto folder one.

I don't know for others but I'll try not to be offended.

> how does the atari boot ?
>
> is its OS code kept all in rom, or does the rom load the os from a floppy?

very old versions of the OS were on floppy, with a simple boot loader
in ROM. Now the OS is in ROM. However on bootup it

- checks for some hardware cartridge and jump into them at some point
- after reset it checks and in some conditions it jumps to a reset-resident programs
- it loads the floppy bootsector, and if this bootsector is executable, it jumps in
- it then try to execute an executable boot sector found on hard disks.
- finally programs found in the X:\AUTO folder are executed one after another (where X: stands for the letter of the boot drive, either the floppy or a partition in a hard disk)
- at last the desktop appears.

> linux works on the atari right?

It is said so, but I never checked, as I only have a bare 68000
atari or emulators.

> how does linux boot on the atari so that it can take over the machine?

I suppose it is run from the auto folder, or perhaps launched by
boot loaders that can be installed on the MBR of the first hard
disk, (like LILO?)

> how would i go about making an atari boot my own code from, say, a floppy
> disk?

simply ensure that the first sector of your floppy has the right
checksum. For details, just have a look at the source code for
EmuTOS, a re-writing of the Atari ST OS covered in GPL, at

  http://emutos.sf.net

especially the files bios/floppy.c and bios/blkdev.c (for the
floppy). As EmuTOS is self-contained, and runs currently on actual
and emulated hardware from 68000 to 68040, I think you might
find other valuable info there.

Dunno about Linux, but I recall some guy running MINIX on a barebones ST
with one of the olde "shoebox" HDDs attached, back in the late '80s...

And certainly we had a TT030 running a complete AT&T UNIX SVR4 system with
X-windows and Motif (I think it was Motif) on it (a bit unstable, but it was
a prototype, anyway). That was in '91, I think.

Where in North America can one buy a Hades (complete or motherboard kit only).
Am interested primarily in a motherboard kit for a relatively low price.

Thanks,
Sam F.

I think it's just the "timeout" value of the floppy drive having to expire before the system finally decides there's no readable floppy in the drive.

The system tries to read anything in the "AUTO" folder on the floppy drive during the boot process.

If there is no disk in the drive, the system gets a read error and retries until the timeout expires.

With a disk in the drive, the system receives a "file not found" error immediately and moves on.

That's my guess, anyway.

BobR

Absolutley, the timeout value is 30 seconds, the same as the printer timeout.

>

Well only files that end in .PRG and .TOS AFAIK.

> If there is no disk in the drive, the system gets a read error and

To allow people time to hunt for that boot disk, when they should have found it "before" turning the computer on.

> With a disk in the drive, the system receives a "file not found" error

Hi Nicolas

| Nick.-
|
| Ex Atari Corp (Spain) Employee (loooooong ago!)

I'm starting an Atari museum at my Atari club, could we please stuff and mount yourself and put you in a display case.

How abut dishing some dirt on the "Real" Atari Corp, with none of the press-dressed ballux..

Hi Ben

| (i come from the world of pcs so please forgive me if i make some awful
| asumptions ;-)

For which you will suffer severe insulting!. 8-)

| how does the atari boot ?

In General, at switch on the machine firstly checks for the precense of a cartridge, if the cart is present and is a bootable cart then control is handed straight to the cart, if no cart the floppy drive is checked for an executable bootsector, if so this will be executed, the actions following this will depend on the executed code, if the floppy is non-executable or gives a return to the OS then the ACSI chain is scanned for devices from numbers 0 to 6, if any contains an executable bootsector then control is handed to the relevant code, if the code returns control then the subsystems are initialised and then Auto folder programs are run and any accesories are loaded and run, control is now handed to the desktop, what hapens next depends on the user.

| is its OS code kept all in rom, or does the rom load the os from a floppy?

Only the early Atari's had the OS on disk and had a bootloader subsystem in ROM to load it.

| linux works on the atari right?

Extremely well, but only on 68030 powered machines i believe.

| how does linux boot on the atari so that it can take over the machine?

It patches into the hard disk bootloader.

| how would i go about making an atari boot my own code from, say, a floppy
| disk?

Write an executable bootsector or use a so Called AUTO-program, this is an app that resides in a folder called AUTO, on the atari system Any program that resides in such a folder is executed by the OS automatically.

| the reason i ask is since i am working on a hobby os, mostly for the PC,
but
| i want to make it easily portable, so i intend to also write a basic
| functionality to boot on different architecture (M68k processor with MMU).
|

| any links or books?

Millions, welcome to the internet..

HI Hallvard

| > No floppy disk is needed to boot to the desktop, though if there is no

hard
| > drive, a blank floppy in the drive will speed up the boot process
| > considerably.
|
| I've always wondered why this happens. Why does the drive keep spinning
| and spinning seemingly forever if there's no disk inserted, until the
| desktop finally arrives?
| What is the machine actually looking for using the disk drive when it
| starts up?

Its a TOS bug, never caused any harm so it doesn't get mentioned.

My MegaSTE doesn't do it.

Ed, apparently I got one of the last ones or the last one.
Fredi is out of boards, and one key chip is no longer manufactured.
He will write back stating the machine is 'obsolete' and not available
anymore. Someone else just wrote asking for a board.

I wanted to apologize for my bad english in this forum!
Apparently Steve found necessary to answer these questions
again two days after I did :-|

Laurent.

Hi!

Ich habe ein Paar Fragen zu einem Falcon, den ich gerade ergattert habe:

Das Teil hat eine eingebaute IDE-Platte.
- Besteht die M�glichkeit, diese gegen eine gr��ere IDE-Platte bzw.
SCSI-Platte auszutauschen?
- Welches Programm/welche Programme brauche ich, wenn ich die
Partitionierung ver�ndern m�chte? (Programm und Festplattentreiber)
- Wie gro� d�rfen die Partitionen maximal sein? Die im Moment vorhandene
Platte besteht aus kleinen 30er Partitionen.

Speicher: Leider nur 4 MB. Besteht die M�glichkeit, diesen  z.B. mit
PS/2-Simms aufzur�sten?

Und zu guter letzt: Welche Demos/Spiele sind richtig gut, nutzen die
Hardware so richtig aus?

Danke! :-)

If you do what I used to do quite often, i.e forget to plug a mouse in and boot to gem, then use ALT with the arrows to move the mouse cursor, eventually you will hit the help key with ALT pressed which will try to dump the screen to the printer. When there is no printer attached, the machine apparently locks up with no error message and you have to wait 30 seconds for it to come back.

Yes its a bit of a PITA.

No. The *first* three things done are:
- disable interrupts by loading 0x2700 in sr
- reset the external peripherals, using the reset instruction
- check if a diagnostic cartridge is in place and if so, jump in

the reset vector is checked later, after the memory has been
configured, (but it is true that 'ordinary' cartridges are tested
after the reset vector).

Laurent.

God, it's good to think about this stuff again after so long! And after the reset vector, the memory was scanned to see if there were any magic reset-proof programs in memory... or did that happen AFTER the floppy bootsector. Yup, it did, or those viruses wouldn't have worked.

Since I got my emulator up and running I've just been itching to write some 68000, but I have to be rather more constructive right now.. looking for work!

James

Well that settles that. However, there was a gent in the UK who is

selling his Hades and I forwarded his message to this gent. Obsolete? I
do not thing so. No machine is obsolete if people use it.

Hi folks...

major problems with TOS2.06 corrupting a Protar Progate 44Mb Syquest cart drive....under 1.62 everythign is fine, under 2.06 if I write anything to a partition, it corrupts the whole partition....I've tried a new floppy drive, I've tried new TOS ROM's, I've tried HD-Driver 6 and 7.7 (both legit versions I hasten to add) as well as the Protar utils (v4.02) that I got with the drive....any ideas folks?....this si supposed to be going into a friends studio and I really don;t want to have to revert the STe in there as she's so in love with 2.06 (after years with a 1.4 STFM).......

| >
| > My MegaSTE doesn't do it.
|
| How come? Which TOS version is it?
| I have TOS 2.06 in an STe and a Mega STe myself. Haven't had the Mega
| STe for long enough to use it extensively, but know for a fact that on
| the STe (also with TOS 2.06) the timeout seems forever.
|
| Is there something else in the Mega STe which prevents this from
| happening, or are you using an entirely different (or patched) OS from
| me?

My TOS has been heavily modified, its the PAK custom 32bit 3.06, some stuff
heavily modified, some other stuff missing altogether.

:>the drive.

memory fades, but i think that the 1772 floppy controller is looking for a certain number of index pulses from the drive before it shuts it down. depending on the model of disk drive you've got, the index pulses aren't reported unless a floppy is in the drive

i don't remember why the desktop shuts the drive down. it probably just borks the power or something

There is a patch which disables looking for floppy drive B: at bootup,
which helps to reduce the waiting. The patch supposedly does not work if
there actually ARE two drives present.

Technically it should be possible to change the timeout for the floppy,
of course, but I do not know that it has been done.

>The printer timeout makes more sense as I could have forgotten to turn
>it on. It's been a long time since I printed out something on the ST,
>but do you get a "printer is not ready" message before those 30 seconds

>getting that message, and then the chance to turn it on and press [OK]?

Yes, you have to wait for a loooong time before the computer says
that the printer is not ready (and it could just have been turned off-line
to insert paper or something like that).

However, there, for sure, IS a patch to change the printer timeout-
look in the control file for that TOS-patch program which you have.

You will also find disable-floppy-B patch there.

I purchased a ST hardware ISA board for my PC sometime ago from the folks who make the
GEMULATOR and I was wondering if I could pluck the chips out and upgrade my ST?

I thought I only saw three or four ROM chips but they were clearly marked TOS 1.4

Thanks

Hi Peter,

The reason is that I am on my way to visit someone in Asia,
who has an Atari Mega-Ste with a broken Keyboard, and
a ST-1040. I tried to find out a keyboard for him in Sweden
(Stockholm), but it is impossible to find that here. Some solutions
were to buy new keyboards or adapters from UK, or Germany
(costs a lot).

Therefore I wanted to know if it was possible to "Reuse" his old
ST-1040's keyboard and start the Atari-Mega-STE.

Do you know how is it possible to connect the 1040's keyboard
Mega-Ste. Note also that (if I remmember it correct), the Mouse
in Mega-ste is connected to the main box through the Keyboard.

Thanks in advance for your help.

M.V.H,
Saeid.

What is your definition of  ' costs a lot ?'

As you all know, I sell complete unused Mega STE keyboards
for �25 sterling, I will sell the keyboard innards for �10
sterling, plus post.
```

If you or your Asian friend simply can't afford �10 we'll
all have a collection for you, if you're just too tight to
spend �10 on the Mega STE you really don't deserve to own
or have access to an Atari.

Attitude, what attitude? Moi?

Barrie at Keychange.

just reaching for the Nomex....

No problem. Just connect the Gnd, Vcc, Tx and Rx lines, and it will work.

The pinout for the Mega ST/STE keyboard connector:

1 Vcc
2 Vcc
3 Tx

4 Rx
5 Gnd
6 Gnd

There should be a picture of the connector in the Mega STe manual.

ST keyboard:

1 Gnd
2 Not connected. This is the "plugged" hole in the connector.
3 Not used here.
4 Vcc
5 Tx
6 Rx
7 Not used here.
8 Gnd

So the adapter would look like this:

Mega ST/STe/TT	ST keyboard
1 Vcc	4 Vcc
2 Vcc	4 Vcc
3 Tx	6 Rx
4 Rx	5 Tx
5 Gnd	1 + 8 Gnd
6 Gnd	1 + 8 Gnd

This should work, unless I've reversed the pin-numbers on the Mega connector! Please refer to the picture in the manual before making this adapter...

Also, I can't remember if the power-LED on the keyboard will light up, it's possible that it needs +5V on either pin 3 or 7. IIRC one of these is the power-LED, the other the disk-LED.

No, it's a fact, unless you want to break the law and send cash in the
mail. But the exchange-fee alone will double your price. I'm speaking from
experience here...

> Has the Euro passed you by then?

Yes, like with you guys ;-) Anyway, the EURO doesn't make a difference,
the exchange-fee is the same whether I'm buying EUROs, pounds or marks.
And that's for cash. As you know, it's illegal to send cash in the mail.
Cheques are legal, but expensive. Bank transactions are faster and safer,
but even more expensive.

Faster? When I ask the bank to transfer euromoney from Leiden the Netherlands
to Aachen Germany (250 km) it takes 4 days.
In times gone by when cars were pulled by horses it took the Postal StageCoach
3 days to transport the real money.

Educate us then, which law makes it illegal for us to put
small amounts of
cash, e.g. Euros, in a padded bag and send it where ever we
wish?
Nothing to stop UK residents doing this, I checked it with
my bank.

Perhaps Saeid will advise the cost for him to buy Sterling
or Euros in his country.

Barrie at Keychange.

As you know, it's illegal to send cash in the mail. Cheques are legal, but expensive. Bank transactions are faster and safer, but even more expensive.

When ever I purchase anything abroad - unless its from USA I almost always send cash in an international registered letter. The post office here exchanges free of charge (the rate is a little doctored i think) and no-one has ever raised an eyebrow at the counter when I have say put 200 euros inside an envelope with a international registered sticker on the front, and given it to them to post. It takes 2-3 days usually to get to its destination, and when it gets there the guy has cash, not having to wait 5 days for a cheque to clear. I didnt use to do this, till my bank double charged me for wiring money to a german friend. They charged me �13 for the wire and another DEM10 for the guys bank who received the money!

Hey why dont you get a paypal, or nochex account? Then you can use your credit card for purchases. Im sure Barrie at keychange wouldnt mind taking 5 mins of his day to open an account with one of them - if he hasnt already.

BTW, if you want another solution, heres one thats not too expensive: go to the post office and ask for a moneygram. It costs �12 and the money will be at the destination in 15 minutes. They dont charge extra for the conversion. I used this a couple weeks ago to send some money to Canada.

I think you will find that its not that bad purchasing items abroad, there is always a way, and I do most of them quite regularly.

It's no problem to put the keyboard back in the ST when/if one can afford a replacement for the Mega.

Btw. I don't know what you can get for a ST in England, but here in Norway there's plenty of them and you usually get them for free if you ask.

>> No, it's a fact, unless you want to break the law and send

Atleast here in Norway, it is infact illegal to send cash (even "small
amounts") in the mail.

> Nothing to stop UK residents doing this, I checked it with

The only UK resident relevant to this particular discussion is you, and
it's not *you* who has to send cash, is it? ;-)

I don't know where you're from, but here in Norway it's illegal to send cash in the mail. This also applies to USA, where it's a federal offence according to a friend of mine over there.

> days for a cheque to clear. I didnt use to do this, till my bank double

This is quite normal, and has happened to me as well. But I prefer this method anyway, because then I atleast have some proof of payment.

> Hey why dont you get a paypal, or nochex account? Then you can use your

The last time I checked PayPal, I couldn't use it because I was in the wrong country... But this may have changed.

> BTW, if you want another solution, heres one thats not too expensive: go to

Good idea, but it has already doubled the price of Barry's keyboard innards ;-) Buying from abroad is *always* expensive, especially when buying "cheap" stuff.

> I think you will find that its not that bad purchasing items abroad, there
> is always a way, and I do most of them quite regularly.

I've lost quite a lot of money to dishonest dealers in the past, so now I only buy things from abroad if I can buy it through a friend in that country. That usually works very well, especially since I most of the time doesn't have to pay VAT on stuff imported from private persons.

I believe that Gemulator uses the same TOS chips as in the ST. However,
I am not sure TOS 1.4 would work in a regular ST. You may not get the same
result as if you installed them in a STe.

TOS 1.4 is a wonderous improvement to a ST. It works just fine,
and is fast with hard disk handling.

I keep one old machine around, an ST without TOS 1.4, because the
drive alignment disk I have only runs in TOS 1.0 and 1.2. I use that
machine for checking disk drives, and that is the only reason for having
an ST that is not fitted with TOS 1.4

Jim

I cracked open the old ST and there were clearly six chips, and six on the
emulator board and they had the atari stamp on them and everything. Can I
just pluck the old ones out and put the new ones in?

Can someone tell me which chip goes in which socket?

I see Hi0 Hi1 Hi2 and Lo0 Lo2 and Lo2 marked on the tos 1.4 chips

U2
U3
U4
U5
U6
U7

Which sockets are for HI and which ones for LO

Thanks

The USB card reader I bought came with a CompactFlash adapter, so I bought an 8mb CF card for $10 to do some tests. I get the same results as I do with SmartMedia right down to the transfer rates. About 850 kb/sec.
I have the PCMCIA device connected to the Hades SCSI bus, the device is SCSI-2, so someone with a Falcon might get better transfers rates?
I don't know if it's the cards, the adapters, the device itself or the Hades SCSI bus which limits the transfer rates. Anyway the CF cards work equally as well as the SmartMedia which is cool.

I thought some of you might find my tinkering aroud with this stuff interesting. ;-)

Sure it is :-)
I've followed all the related threads.

I'm looking to find such an adaptator (adaptor?) here in France but it looks not to be a very common device (here), especialy for the main one that plugs in the SCSI chain. It's not cheap though, and will be even more expensive if I import it from the USA.

Bye,
/Pascal/

They are expensive, however I got my units from ebay. I paid as little as
26 USD all the way up to 100 USD. Even so 100 USD is half price and since
there are no moving parts the chances of getting a bad unit is very low.
;-)

I'd like to test the SONY memory sticks, however the adapter I found locally
at some electronics shop was over 70 USD. :-P

Yes, thanks. I think I'll have to look into it for a digital camera.
Pity the SCSI readers are quite expensive. I could get IDE I guess as I
have a spare slave as my CD ROM broke.

o I went aheard with my experiment, first soldering back the
>jumper to "drive 1", then booting the computer with the twisted cable
>connected to the drive. the result?
>4 bombs!!!!

That's odd, I've never had bombs due to wrong disks select!

>How come? Isn't even this connection standard?
>The pins reversed are pins 10-16.
>According to this website:
>http://theref.aquascape.com/theref/tech_talk/tech_talk02.html

> When reconnecting the drive, using the non-twisted connector (still with the drive set to "1" as in "PC drive A") it took forever to have the dektop appear and I couldn't read the disk (neither "A" nor "B"), but at least this didn't give me any bombs.

This is usual. TOS trys to find a device to boot from and I guess it times out after about a minute and goes to the desktop reporting no drives.

> Here's the full pinout of the Shugart connector:

```
>
>2  High/low density  1 GND
>4                    3 GND
>6                    5 GND
>8  Index             7 GND
>10 Motor enable A    9 GND
>12 Drive select B   11 GND
>14 Drive select A   13 GND
>16 Motor enable A   15 GND
```

```
 2     Not Connected or Reserved (High Density Detected on some HD drives)
 4      In Use/Head Load/Open - HLD
 6      Drive Select 4 - DS4
 8      Index Pulse Sensor - IP
10      Drive Select 1 - DS1
12      Drive Select 2 - DS2
14      Drive Select 3 - DS3
16      Motor On - MOTOR
```

I have the above and they seem right to me. The ones you got don't seem to support 4 drives which Shugart bus can support. All you need to do is switch over the 12 and 10 wires, worked for me IIRC. All odd numbers are grounds.

PS, Looking at the pinout you got I don't think there are different Motor Ons for every drive because on a two drive system, when you access one drive the motor comes on on the other! Sounds like a shared Motor On as in my pinout.

Which modification?

A standard PC drive works out of the box on any ST, STE, TT provided it is
jumpered for DS0 - the only problem is the front plate / case.

AFAIK it -is- "Shugart" but the orientation of the connector on the
drives was different to that on most later drives, so the cable
had to be twisted which was not easy if it was not long enough.
But still, "Atari" pin 1 corresponds to "Shugart" pin 1, pin 2 to pin 2,
etc. and at least the numbers of the first and the last pins on the
connectors are usually marked both on the Atari motherboard and the
floppy-drive boards.

>
>What do you mean it doesn't matter?
>Obviously there has to be some standard to be followed.

No - the orientazion does not need to be standardized, the pinout is. You
simply plug in the cable so that pin 1 on the connector is on pin 1 of the
drive - voila.

>Does this also mean that PC users are/were having just as many problems
>as we are?

In the beginning: yes. However, since most drives came pre-jumpered the right way, there were not much problems.

>Yes, with the addition of shorting the "disk detect" switch and cutting
>off the connector "notch" so it can be inserted "upside down".

Huh? What disk detect?

Correct, if your cable has the notch on the wrong side,you may have to cut that off.

>And finally there's the power connector which I've seen can either be
>used out of the box, or has to be inserted "upside down" as the voltage
>connectors are reversed.

Never seen that - the connector in 1040ST, MegaST, MegaSTE, TT and Falcon nicely fits on all standard PC drives just the way it is supposed to - putting it on reversed is possible, but does not fit too well.

>So, going back to the mid/late 80's -did PC users suffer from much of
>the same confusion/multitude of choices as we do now, or did the
>"standard" disk drives back then also connect "upside down" compared to
>3.5" drives of today?

The only "upside down"-drives I have seen have been in Ataris - however, I do not understand the confusion about that. As with every connector, you make sure to connect pin 1 of the cable to pin 1 of the drive, no matter where that may be located.

>What I'm trying to ask is if Atari had their own specific standard
>(which I find hard to believe, with the extra costs involved, knowing
>Atari were known to cut corners), or if the off-the-shelf drives at the
>time differed from standard off-the-shelf drives of today?

It was probably just one series of drives by one or two manufacturers - which were not that common in PCs. Most PCs here had drives from Teac, Mitsumi or Panasonic - I have never seen Epson drives in PCs, although they were probably sold.

It is - however, it requires a PC-style floppy controller connector, which has separate motor-on signals for the two drives - the Atari does not have separate motor on signals, so you have to use a straight cable for both drives and jumper them to DS0 and DS1.

That is the way the original Shugart "standard" was meant to be used - IBM decided they only needed two of the possible 4 disk drives, and instead added the additional motor-on signal (which was a good idea for 5.25" drives). Except from this changed pinout (on the FDC side), the pinout on the drives is still the same, since IBM didn't want to use special-made drives. An added benefit is that the field service can replace drives without re-jumpering them ...

On the computer side: yes.

On the drive side: No. On the drive side, PC and ST are the same (and that
was all Shugart specified - the connector on the drive).

Right (as long as we only talk about 3.5" drives - on 5.25", there are differences between PC/XT and AT controllers).

>There are 3 micro-switches at the front (disk-insert end):
>From the left (underneath view):
>
>Write-protect   Disk-detect   HD-detect
>
>The "Disk detect" (it might officially be called something else, but
>this is basically what it is) detects if a disk is present or not.
>It has to be shorted (a wire soldered across it so that it's always on),
>or else the computer won't detect a media change when another disk is
>inserted.

Ah - that's due to Ataris braindead disk-change detection. Instead of using the disk-change signal (like they did on TT/Falcon), the watch for a change on write protect. Now some drives only report write-protect status if a disk is inserted ...

Correct, if you have such a drive, you need to modify it. Seems I was lucky with my drives in that they reported write protect even with no disk inserted.

>My documentation is written mainly for people who are *not* hardware
>experts, but merely someone who uses an Atari ST and wants/needs to
>change his/her disk drive.
>I doubt very much that these people will dig up Atari circuit

>schematics, use a multimeter and trace which pins go to where when the
>connector already fits. They will most likely just insert the connector
>(which of course doesn't work in this case).

Agreed.

>So... I'm telling them in the documentation that with a standard PC
>drive they have to reverse the connector to make it work.

Don't tell them to reverse the connector - tell them how to detect the correct orientation.

However, trial-and-error works fine onthe data connector: if the floppy LED stays on all the time after power-on, the connector is plugged in the wrong way (and no harm is done, except that inserted disks are erased on track 0).

>Another question... did *all* drives fitted in Atari ST computers have
>the connectors fitted the same way?

Not sure. It may be that it changed when Atari fitted HD drives.

>orientation the same way (I find it hard to believe that PC users have
>to check the orientation as well instead of just plugging the connector
>into the drive which will work every time), did *some* Atari fitted

That would require you to know *which* way to insert the connector. Since the connectors are not keyed on most PCs, you can insert the cables both ways. So yes, reversing the data connector is quite common with people fiddling with their PCs.

You can get "ST mono" resolution on any PC monitor with the right cable.
On the other hand, you can get every ST resolution (low colour, medium colour, and high mono) with a good multisync monitor and the right cable(s).

I use a NEC 3D for this. I have to say, though, that *NOTHING* beats the picture quality on a real Atari monitor, especially in high resolution.

You also might want to download the "Gemulator" program for free from emulators.com and run most Atari programs on your PC. Just a thought...

Hope this helps,
Randy Kwak

I'm not sure about the problems reported, but that is NOT the
"standard" PC floppy cable connection setup.

The "standard" PC floppy cable has a connector at one end of the
cable, which is isolated from the other two by some distance. THIS
is the connector which goes to the motherboard - NOT - the center
connector on the cable.

The MIDDLE connector goes to the "B" drive, the OTHER END (the end
past the "twist" in the cable from the other connectors) goes to the
"A" drive.

Dunno if this will come through very well-

```
O------------------O----x----O
MB                  "B"        "A"
```

Give it a go with the cable hooked up like this and see what happens

That is the modification I have documentated.

>Correct, if you have such a drive, you need to modify it. Seems I was lucky
>with my drives in that they reported write protect even with no disk
>inserted.

Yes, I have a PC drive that works fine in my ST but all my others didn't.
The drives from old Acorn computers work very well in STs! The DS0/1 is
at a flick of a small microswitch located at the rear of the drive and
I've never had a failed drive unlike all the rubbish modern PC drives.

I would like to put a little input into the this disscusion. I have some
5 or so PC drives of varying date. When connected to my Falcon they work
but some disks did not work, Lattice C disk 5 and a couple of others. I
think they are formatted to an odd standard, ie more tracks and sectors to
cram more data on. I have only had success reading these disks with
flopyp drives from Acorns and Ataris. So, whenever I install Lattice C on
my Falcon I have to plug in my old Falcon drive instead of the PC drive!!

>>Another question... did *all* drives fitted in Atari ST computers have

>>the connectors fitted the same way?
>
>Not sure. It may be that it changed when Atari fitted HD drives.

All the STs and STEs I've seen have this upside down connector. I can't
remember what the Falcon was like as mine is not in it's stock form.

I've never had to conenct the power conenctor around the other way.

Actually it's the other way around for the PC.

The drives come pre-jumpered to DS1 because the assumption was that they would be used to add a "B" drive to a single floppy system that only had an "A" drive.

The twist in the cable takes care of reversing the Drive Select signals so that such a pre-jumpered drive could be used as a REPLACEMENT for a defective "A" drive (DS0) without having to change the jumpers from DS1.

Actually, for the sake of completeness, some early STFMs with
single-sided Chinon drives used some strange, smaller connector on
the drive; there was a small PCB mounted next to the drive with a
Shugart plug at one end and a pigtail lead to the drive with a
suitable socket at the other. My STFM came like that, with a
special change-over switch added connected to pins 19 and 20 of
the Yamaha sound chip, so that I could boot from the external DS
drive. Later when I replaced the Chinon with a Sony DS DD, I just
removed the PCB and plugged the Shugart lead into the new drive -
worked fine!

Regards, /Peter/

Hmm... well, since you've said it's working now, this is probably
just a "nit pick", but this is still backwards.

(It may not matter since it's working, but if the intent is to
document everything for other people to follow, it's probably

important for it to be right.)

The A drive has to be on the other side of the twist from the computer, since it's jumpered as DS1.

The twist reverses the drive selects and turns it into DS0.

The B drive has to be on the computer side of the twist since it's jumpered as DS1, and needs to STAY as DS1.

I think what's happened is that you eventually modified the cable to make it work, even though you've got the DS0 and DS1 assignments backwards.

>With SCSI this would probably matter as you shouldn't have any loose
>ends without termination, but with floppy disk drives?
>I might however actually connect something to the end of that cable... a

>some pointers.

At floppy drive speeds, the unterminated cable probably won't matter.

That's probably another good reason why they designed the cable to put the A drive at the far end from the computer though.   It would guarantee there would be no "stubs" to cause ringing on the cable.

Hi everyone,
is it possible to replace the drive in a Megafile30 with
a larger one so that the DMA connector can be used instead of finding a link
or similar?

That's basically possible, provided you can find a working MFM or RLL
drive. Using a Link and a SCSI drive makes more sense, IMO, and is
considerably faster (appr. four times faster) with respect to transfer
rates.

```

Thanks Uwe. I would think those drives are harder to find than a Link so
I'll just have to keep it as it is. It's a set-up for the kids so it's good
enough but as you may remember from a previous posting I've been having some
trouble running some, not all , programs from the drive.

Chris Thorley.

I am using The Atari/Notator 3.21 with my PC and Cakewalk 7.0. What I am attempting to do is record my audio tracks via my sound card while midi sync'ing into Cakewalk. Cakewalk goes into midi sync record ready mode just fine and it even records my audio tracks but when I play back my tracks I hear a warbled sound.

If I record manually the audio recording is smooth but in midi sync mode I get this warbled sound in my audio tracks.

There are more things I plan on trying but it would be nice if someone here has already been down this road that can help me much faster just in case I am trying to solve this the long way.

Thanks group.
Dave H.

Do anybody know a program that can recover/reconstruct the FAT if the data
still on the disk but the FAT has been erased by misstake (no comment
please... we all do dumb thing sometimes, specialy clicking on the wrong
button)...

Thanks, Rodolphe

I think there is a option like this in HDDriver but looking at it, if
there is no FAT, how can you tell what clusters belong to which files? It
would just look like a huge string of bytes!! There are two FATs, IIRC
the second is a complete copy of the first. Perhaps that helps?

I've erased both FAT by misstake. I remember doing a FAT reconstruction
"by hand" a few years ago. Of course you still need to find the first
sector of each files and I don't care about binaries as this partition
was me assembly sources (so text files).

Thanks anyway.

Regards, Rodolphe

I don't remember if the ST does the same thing, but MS-DOS has two FAT tables, stored in different sectors. Search through the floppy from the start of the disk and see if you come across another FAT table. If it's there, just copy it to where the first FAT table is supposed to go. It's been way too long, so I couldn't even offer the name of a sector editor that'd do it. Presumably there's at least one shareware/PD one on one of the FTP sites.

If you can read German and are willing to spend money for commercial
software have a look at DISKUS: http://www.seimet.de/atari_english.html
DISKUS offers a lot of functions for recovering data, including
functions that help to repair erased FATs.
Note that in general you can only repair much of the FAT if the
partition is not too fragmented. The higher the level of fragmentation,
the harder it is to undo the damage.

No, there is no such option in HDDRIVER. HDDRIVER is not a tool for
checking and repairing data. It's a hard disk driver in the first
place.
Usually both FATs are written at the same time, so using the copy may
work, but most of the time it doesn't ;-).
Note that it is possible up to a certain degree to let software decide
which clusters belong to which file. DISKUS, in particular, if the
partition is not fragmented, or at least there is only minor
fragmentation, and the directory entries are still present and correct,
can recover the complete partition, even if the FAT is completely
destroyed. You can also do this manually, but this will take you a huge
amount of time ...

```

Me neither - I started with an 80Mb Quantum in a FA.ST case with AdSCSI many years ago - but it's too imaginative to suspect Atari of trying to lock people into their method. At the time of the first ST's release the SCSI standard hadn't been finalised. It was just the best. closest and quickest option at the time. Nothing more AIUI...

At the time they were designed, there was no such thing as a "standard".
Shugart did it their way, Atari did it their way, and they worked
equally well, and contained the same information, which is why it
is possible to build a Link, and make a now-called scsi bus from the
data on a asci bus.

This is basically correct, but note that SCSI offers several features that you do not get with ACSI.

Hello Uwe!

(Yes I'm back, couldn't keep away when I spotted this thread! ;-)

US> ...note that SCSI offers several features that you do not get
> with ACSI.

Are you able to give us a quick list of the missing features? I seem
to recall you implying that a thorough implementation of SCSI was not
practical on the ST. Is this because of some of the missing features?

Regards,
  - Andy Ball

I don't have the time to go into detail. You should consult the SCSI
standard instead. The most prominent missing features are SCSI messaging
or the capability of the ST to act as a SCSI target. This leads to

numerous implications. Note that there are no restrictions with TT and Falcon.

Hello Uwe!

US> I don't have the time to go into detail. You should
> consult the SCSI standard instead.

I'm more familiar with SCSI than with ACSI, perhaps I should
dig up some docs on ACSI.

US> The most prominent missing features are SCSI messaging
> or the capability of the ST to act as a SCSI target.

I can see how that would be slightly limiting.

US> Note that there are no restrictions with TT and Falcon.

Thanks, that's good to hear!

Regards,
  - Andy Ball.

Hi Atarians

I recently came across some files with the following extensions, .DCM and .ATR.

After some detective work I found them to be ATARI files as follows,

.DCM - Disk Communicator Format -- For use with ATARI hardware

.ATR - ATARI Disk Image Format   -- For use with emulator.

Any kind person out there like to explain further on What,Where How and When these are used etc.

Regards

Derek

This is an entire image of a floppy disk, in a file.  Emulators on
other platforms use these files to simulate Atari disk drives. I seem
to remember XFormer used a similar concept - an Atari 8-bit emulator
on the ST.

To use an emulator with existing software, you would need to have a
utility to convert a disk to this file format I guess.

These files are also used with APE and SIO2PC, which allows a PC (yuk) to be used as a wopping big floppy drive for your superior 800XL. A periphial emulator of sorts.

The problem with ST resolutions is that the horizontal frequency is 15.75KHz, not many VGA/SVGA monitors will sync down to this and PC's use a 31.5 KHz. In addition the vertical frequency is 50Hz in many applications and again not many (but quite a few, more than the other) monitors will sync to 50Hz.

So you can either get a scan doubler, or a multisync monitor.

The cheapest scan doubler I have seen is the "Cheese", which is about 70 US dollars, or 65 UK Pounds. However because the input is Composite, the picture quality is not perfect.

With a modern multisync monitor something like a scan doubler is
needed too. At least I haven't seen ones that go below 30 kHz for
quite some years now.
The 'cheese box' seems to be similar to the MatCo VGA-801.
Since the ST has only RGB output and no composite output something
like the 'Video key' Edward mentioned is needed since the 'cheese box'
and the 'VGA-801' both need composite input.

Could anyone help me? My Ricoh LP 1200 laser printer has just died and I need to buy a new one. Can anyone suggest a printer which would be compatible with the music program Notator? I'm getting no help at all locally and have a fairly urgent deadline to meet! Thanks.

If you want to share a monitor between a PC and Atari then one of the TV
cards which
also has RGB in can be used to display the ST display on the PC monitor.
Not very "Atarish" I know, but its often cheaper than the solutions below.

I did also try composite in but thats definitley not very good....

I used an NEC 3D Multisync with both my ST and a 386PC. Used ones can still be found in the US, usually at computer flea markets - typically $25 or so. An adapter cable is needed for the ST and mine had a switch box in the middle that let it switch between ST low/med and Hi rez. It is a 14 inch monitor - kind of lame by today's PC standards - but looked great with the ST and adequate on the PC. I even used the monitor with my first Pentium. Decent screen at 800x600. It would do 1024x768 - photos were ok but text was barely readable. I still have it. All of my Atari monitors bit the dust but the NEC 3D still works fine - it is on my workbench and I use it when building or upgrading a PC.

I tried others on the ST, even an NEC 3F (?) wouldn't sync with it.

AHDI is the hard disk driver, executable version (same file as shdriver.sys). If after booting the computer with the hard disk properly connected you run it from a floppy, the hard disk should be recognized. If the driver is not partitioned, you can do the job with hdx.prg. If it is already setup, you can open it from the desktop. I think drive C: should appear straight on on the desktop, if not, use the install drive item fron the extras menu and choose letter C for the drive. If there is more than a partition, you must install the icons manually. To make the drive auto boot, you should copy at least shdriver.sys to the root directory of drive C:. I think that you don't have to create a boot sector, as is the case with bootable floppies (only having an auto folder). Anyway, autoboot setup was made known of mine releases of AHDI with HINSTALL.PRG. I don't know why is missing. Yo have the latest versions free downloable from the net (until 5.5, I think).

To sumarize, if after running ahdi.prg you run hdx.prg and it doesn't recognize the driver, then something is wrong.

Hope that this helps.

Regards

Re Export and other modem multiport expanders.

(Not the Midex+, Unitor N/C/2 or parallel port expanders or single port
version).

You will know from my previous posts on this subject I think the Export
makes a good paper weight.

I base this on many customers reporting notes missing or hanging, choking
etc.

Have any Notator or Cubase users any experience using these items, either as
a means of separating GM modules using one output at a time or running 40+
tracks over three outputs, flat out?

Copied to Tims' Atari group too.

I don't have HINSTALL.PRG. I just search the net and can't find it. Could you possibly send it to me?

What I'd really like is to find somewhere on the net where I can read the definitive Atari instructions for setting up the Atari hard drive and all software needed. I have the programs I mentioned above, but not the HINSTALL.PRG.

Neither Ahdi nor Hdx seem to recognize the hard drive. But, I think it's OK. When I turn it on, I can hear it running and the lights flicker. I don't think it's busted, although I suppose it could be. The guy who sold it to me seems very professional (being a doctor) and he said it's OK. I see now reason why he'd lie about it.

I was under the impression that PhotoTip would automatically issue a forced
media change with the addition of a small prog in its directory?

Have you updated to PhotoTip 3.01 BTW, it now has English hypertext and
Bubblegem help files, thanks to DDP Translations.

Perhaps I wasn't clear enough, let's see if I can clearify things. I take about 64 pictures on my camera at 1600x1200, all aprox. 400k or more in size. Load PhotoTip and wait quite some time for it to transfer these

```
across the rs232 cable.  Or I make a huge quicktime movie on the camera,
which Aniplyer can play btw, and again a huge wait for transfers.

With the Microtech drive, I simply remove the smartmedia from the camera,
insert into the Hades060, and pop open a directory window to the camera
media. Lasso the pics and drag them to my hard drive.  64 images transfered
in no time at all.  Phototip was not needed at all, although it is a nice
app.  It's when I first put the smartmedia into the hades I have to do
a force media change, the pc format on the smartmedia card might be a little
non-standard or HD driver doesn't notice I changed it.  Anyway it's a
minor problem and I get the pics from the camera rather fast.
These scsi PCMCIA things are quite cool actually.   ;-)

>minor problem and I get the pics from the camera rather fast.
>These scsi PCMCIA things are quite cool actually.   ;-)

And which camera is this? I may be getting one so if I can get one that'll work on both Falcon and PC then it'll great!

> all?

I have not tried booting from such a card, it should work, it appears to the system as a standard SCSI hard drive. Correct, in fact I do just that, I leave a 128mb card in one slot, the ones I have have 2 slots and uses 2 consecutive SCSI ID's. The smartmedia benchmarks at around 830 bytes per second. That might be annoyingly slow for boot up. CompactFlash adheres more closely to the PCMCIA spec, it should be much faster, but I've not tried that either, such test would cost me money. ;-) There is also an adapter for the SONY memory stick.

Smartmedia goes up to 128mb, compactflash I've seen 256mb, and even 512mb modules in ads.

> What about the card-reader? Is this a standard SCSI device which can be
> used with any SCSI host-adapter and HDdriver software?

I have 2 units actually in my hades, 2 dual ones, so I have 4 PCMCIA slots and on my TT I have an external unit as well. All I use use is HD driver.

Yes, the above works great. I have used this method alot over the
years. Also remember to back up your hard drive...

Hi

Perhaps I should be posting to a sci.electronics newsgroup but I'll give it a go here. I was just about to send a Falcon PSU to someone after receiving his cheque. I checked the PSU over after it being in my loft for almost a year now. I power it up and the 5 volt line seems OK, about 5.06V. The 12V line starts off at about 7v and quite quickly drops down and down. I promtly switch off here as the PSU clicks and slows down in relation to the voltage dropping on the 12v line.

I'm not SMPS expert so I was wondering if anyone know anything about them?
I've checked for resistance across the 12v and GND and it's about 400 ohm
which sounds fine. I then run back through the board to the transformer.
All the conenctions on the low voltage side seem to conenct, I mean, they
all have about 0.3ohm reistance between the 4 terminals!!

From the underside there are 4 terminals of the transformer, two go to the
5v supply circuitry, one other that goes to 12v side and one GND pin. The
circuitry seems to charge up a capacitor with a diode and inductor,
presumably to up the voltage a little.

Do SMPS transformer really having DC resistances as low as 0.3 ohm! I've
checked with a couple of DMMs.

First try what happens when you use the IN conector on the drive...
maybe everything is already set up and the drive will boot. If not...
about the files ... if I remember AHDI correctly... use them from a
floppy drive first. You may put AHDI.PRG in AUTO folder on the floppy-
that is the disk driver. When you boot the machine from the floppy,

use HDX.PRG to format and partition the drive if needed. SHDRIV.SYS is basically the same file as AHDI.PRG (probably has the same length), and it should go to the root of hard drive. I believe there should be yet another file, HINSTALL.PRG or something like that (or maybe HDX has this option in some menu item) to "install" the driver- i.e. write information in the boot sector of the hard disk, pointing to SHDRIV.SYS. After that the hard drive should be bootable.

Lyndon,

I had a Falcon power supply that did the same thing. And it also caused the hard drive not to boot. I listened carefully to the clicking coming from the power supply and found it to be a capacitor that was clicking. I replaced the capacitor and never had a problem with it again. If I remember correctly it was the large capacitor on the lower left hand side of the power supply board that was bad.

Hope this helps,

Don

Except that you can use PhotoTip's cataloging etc facilities using your SmartMedia drive the source, and use the tip I mentioned re the forced media change.

I agree that it's a faster process than downloading via the serial cable, that's not in question.

I see your point. I found PhotoTip to be a very nice app, however forcing
me to use wdialog (made my Hades unstable) was my other motivation to
explore other transfer methods as well. That what happens "here" anyway,
I'm sure it works fine for others.

I hope you had a load connected?

Lots os SMPS (expecially the cheaper ones with more simple regulation
circuits) may misbehave or even blow up if the load is below the spec'd
minimum value.

>Do SMPS transformer really having DC resistances as low as 0.3 ohm! I've

OK, I'll have a go. Your description sounds like the main high voltage
capacitor. I'm not putting my head anywhere near these things. I've had
shocks off them and it ain't fun ;)

Hi Michael,

>I hope you had a load connected?
>
>Lots os SMPS (expecially the cheaper ones with more simple regulation
>circuits) may misbehave or even blow up if the load is below the spec'd
>minimum value.

I have just stuck a load in (2.2watt 12v bulb) on the 12v line and it
didn't work.
I then recieved an email from Steve Sweet (cheers!) saying that these PSUs
are regulated on the 5v side, so I suck two loads in on both lines and
voila! Back to normal. I just sent my cheque back to the guy who was
going to buy it, argh!

>>Do SMPS transformer really having DC resistances as low as 0.3 ohm! I've
>>checked with a couple of DMMs.
>
>That may be OK.

As I've been told that is normal. You can tell I only deal with good old
rectifier/large toridal/capacitor PSUs ;)

Thanks to everones quick replies, I've used AT PSUs before to power my
computers and never had problems with them not having loads. I seem to
remember my ST PSU not needing a load.

So what was that ticking? Sounded like arcing windings!

It depends on the model. Some work fine without load, some don't, some even
blow up, so don't take chances.

>So what was that ticking? Sounded like arcing windings!

Probably the primary-side oscillator starting up and shutting down
immediately, and then re-starting after some 100ms.

Thanks! I had found all the programs in various places but without the instructions. Now I'll go see if I can get it to work.

* Maybe a short in the 12V circuit (diode, capacitor, resistor...)- especially if the PSU complains audibly. 12V output is basically a separate secondary winding from the same transformer as the 5V; if 5V works OK, the PSU should be more-less alive. If you have 0.3 Ohm everywhere with both polarities of the DVM probes, check the 12V rectifying diode.

* I had a case of a dead resistor in a PSU (some of them heat pretty much).

* Note that switching power supplies must have some load attached. There are supposed to be large resistors in the output stages (cca 68-120 Ohm) to provide this load.

* Which model of the PSU is that? Do you have a schematics? I suppose a schematic would be helpful; and they can be found.

Have you tried measuring it on load (a 12V side-light bulb will
do)? Many PSUs have protection circuitry that shuts them down with
no load applied, though normally this runs off the 5V line I think.

>Do SMPS transformer really having DC resistances as low as 0.3 ohm! I've
>checked with a couple of DMMs.

Quite possible. But could also be a blown, shorted cap. Try
applying an external volatge (with the PSU disconnected) and see
how fast it drops off when you remove it - with a DMM it should
take several seconds. There is a separate rectifier diode (D101 on
my circuit) - check that too.

Regards, /Peter/

Hi,

I need sample sample files of the following file formats:

.NEO   2bit Grafik Files   (NeoChrome Graphic Program)
.PI1   2bit Grafik Files   (Degas File)

does anyone have such (valid) files and can send them to me???

thanks

Wolfgang

Both are actually lowres files and therefore contain 4Bit per pixel not 2Bit.
2Bit per pixel would be medres and called .PI2 in Degas.
Neochrome pictures are lowres only.

I picked up a usb card reader/writer for the imac. For anyone wanting to know I can now move large amounts of data to and from my Atari now. The only requirement being that the smartmedia be DOS formatted. Thanks guys, for the imac card reader/writer tips! This will do until a reasonable ethernet solution comes along.

Anyone have luck with installing NetBSD OS onto either system???   Just picked up NetBSD 1.5 on CD from Linux central.... has some notes in the

readme's about TT's, Falcon030 video support and so forth, but the installs
are all i386, MacPPC, Vax Alpha and MIPs centric, nothing on M68K
systems.... any help greatly appreciated, thanks.

Curt

I would doubt it - both of these are 16-colour ST-Low resolutions.
However .PI2 would be 4-colour, i.e. 2 bits (and .PI3 mono/1 bit).
AFAIK Neochrome did not work in 2-bit (of course you could use
just the 4 colours, but it would still be saved in 4-bit).

Regards, /Peter/

Hi Hallvard-

I'm also interested in this as I intend to do digital recording
sometime in the near future - with the mics, piano, computer, and
hard drives all in the same room.

I just went to Seagate's page, and they have some new hard drives
out that are "supposed" to be really quiet. I think it was the
"U" series. In their search box try typing "acoustic", and you'll
get a lot of info. One of them was:

http://www.seagate.com/cda/newsinfo/newsroom/releases/article/0,1
121,428^4^1,00.html

Maybe you've already looked into Seagate's products, I thought I
should mention this anyway.

Hope that helps,

I'm not sure what CDROM you have exactly (there are more than one ;-), but
for installation docu for NetBSD on the atari, you can check:
http://www.netbsd.org/Ports/atari/ . To store all installation sets for
all supported 1.5 platforms, you'll need at least 2 CD's. Maybe the atari
stuff is on the second CD?

Leo.

Would anybody be interested in buying a Mega ST 2? I also have a Mega ST 4
which has a few upgrades, but I'm not sure if I want to sell that :)

I am open to offers - post replies here.

Anyone here use an Akai DR4D? I tried to copy and paste a chorus line to another section of a song according to the book [I followed it excactly and tried several times] but my buttons won't light up at that point therefore I cannot proceed with the steps. Is the manual wrong or is my unit defective?

The track button lights work and everything else works fine.

Dave H.

Hi,
All the "Classical" Atari machines have an "ACSI" (I think thats what its called) "Atari Computer Systems Interface" which is basically a cut down SCSI interface. I am not sure if it was cut down to cut costs (probably) or to lock folks into ATARI hard drives (possibly), but any way it is a complete pain. Some later machines have IDE interfaces, which is the same standard that modern PCs use.

Both PCs and Ataris use a variety of disk drives. Hard drives come in basically three flavours. MFM/RLL, SCSI and IDE.

MFM/RLL drives (now obsolete) do not have an on-board controller. There is some interface logic, but they require an external controller to take the serial data from the head, and convert it to bytes and visa versa. They also need logic to step the head from track-to-track. Think of them as a larger, faster version of a floppy. These drives were used on early PC's, and also on Atari computers. On PC's there were dedicated controllers. On the ST they were often interfaced using two cards. One to convert ACSI to SCSI and a second to convert the SCSI to MFM. However some ST drives had a single card to do the job.

SCSI is a generic interface designed to support a variety of devices, such as Tape, Scanners and Disks. A SCSI drive needs an intelligant on-board controller so SCSI drivers were more expensive that MFM/RLL. There are a wide selection of adaptors that coinvert ACSI to SCSI so this type of drive is often used. Whatch as there a several versions of SCSI. differ in terms of voltage levels, and the number of signal lins involved.

IDE was design as a cheap interface. Unlike SCSI which supports at least 7 drives per interface the original IDE only supported one. It also only supported disks, no tape, CD or scanner. IDE drives interface via a failry simple port, rather like a 16 bit printer interface. I have never seen an IDE to SCSI or ACSI interface. Most PC's and later Ataris use this type of drive, but to put one on a "Classic" Atari requires internal hardware mod. I have an STE with a 2.5" (i.e. small size") IDE driver mounted internally.

So there is no one standard. IDE and SCSI have several versions. Which is
right fior which ST varies.

Dave.

It is shugart, just for some reason some drives were manufactured with the notch in the wrong place. Really weird TBH. The other problems are probably due to newer floppy drive manifacteurs cutting costs and realising a lot of the stuff (like media detection) could be done other ways, like in the BIOS by checking other signals.

"The nice thing about standards is there are so many to choose from", or
so they say. The original Shugart drives were 8"; from there to 5.25"
and 3.5" drives many features were added, and some became obsolete.

E.g., the original full height Shugart 8" drives had 110/220V motors
that always ran, and the head was loaded on demand. Nowadays, the drive
motor runs on 5V, is controlled by the computer and the head is always
loaded, freeing a line on the interface for other purposes.

On the other hand, today's 3.5" drives offer DD/HD density detection
that the 5.25" drives do not have. You end up with a set of options that
are projected on pins 2, 4, 34 in varying order.

> I find it hard to believe that Atari ordered custom designed disk drives
> when it's now pretty easy to modify a standard PC drive which will work
> just fine.

3.5" drives were brand new in '85, and being electrically compatible to
5.25" drives, they mirrored their multitude of options. There probably
was not One Standard to follow.

Most likely... Although much of that information significantly predates
the Web Age.

Still, Google is your friend, esp. groups.google.com. They are still in
the alt.folklore.computers, comp.os.cpm should be good starting points.

HTH,
hauke

Hello,

This might be a really daft question, but I guess I have to live with the humiliation :)
Is there any way I can make a typical modern-day PC monitor to work with an Atari ST?

Thanks a lot for your help!
Regards, Karl

It is Shugart (the orientation of the connector does not matter at all).

However, "Shugart" never was an official standard - it was one of the early drive manufacturers, and after that, the pinout stayed mostly compatible, although there are differences in handling of some signals - disk change, high density (input vs. output) etc. - thats why older drives had a *lot* of jumpers.

Nowadays, most systems use the pinout that PCs use. The ST uses the same, only with DS0 instead of DS1 for the first drive. A PC drive works out of the box on a ST when jumpered to DS0.

Huh?

All current PC drives handle disk change the same way it was always done on PCs - it was Atari that decided to leave out that line and implement some weird workaround that worked more or less (depending on the drive used).

Hi David

| All the "Classical" Atari machines have an "ACSI" (I think thats what its
| called) "Atari Computer Systems Interface" which is basically a cut down
| SCSI interface. I am not sure if it was cut down to cut costs (probably)
| or to lock folks into ATARI hard drives (possibly),

If that's the case it failed, I've never had an Atari hard drive, I'm
currently using a pair of 4.5Gig drives on my machine

Ok, can't remember which way it was around.  I have docs here to do the
modification but I've never needed it as the PC drive I used had no
problems with my ST.

no, it was mentioned in an Atari ST User magazine.

Yes, there is a way. I hear there is a cable that will allow you to do
this. I do not have it and have never seen it, but I am sure it exists.
I do it by using two pieces of hardware. First, there is something
called a Video Key and it was made by Practical Peripherals and second,
a video converter. The Video Key plugs into the monitor port of the ST.
It has a video out RCA (yellow) port on it and that is what is
connected to the video converter. The PC monitor then plugs into the
converter. The resulting picture is not perfect, but it works.

In black and white, it's just a matter of connecting the correct pins on the monitor and the ST monitor port.

Don't forget TOS 3.01. I got my TT quite early and TOS 3.01 was running
on it. I later replaced it with 3.05 and then with 3.06.

Hi Alexander

"Alexander Holland" <a1_nocrap_exh@hotmail.com> wrote in message
news:7f38b97b.0111210323.4a080d92@posting.google.com...
| Hi,
|
| Anyone ever scan in the Schematics for the TT030?? I know that the
| ST/STe/MegaST/MegaSTe schematics are all available but did anyone do
| the TT030 ones?

|
| If not does anyone know what type of EEPROM's the TT takes for TOS?
|
| When fitting EEPROM's in an STe you have to change some Jumpers
| depending on the type of EEPROM you are using. Does the TT have these
| jumpers? Where are they what are their number (i.e. U102, J12 etc.)

I dont thaink thats been done by anybody, TOS for TT's was only ever TOS
3.06 and no upgrades have ever been available.

| I was thinking I might be able to use 4x27M1001 (128k*8bit) EEPROMS
| that are in STe's?

TT TOS ROMS were faster than ST ROMS also.

Hi Martijn

| I just tried it and it works :-) Thanks for the explanation, guys. So it
| isn't a problem, but a feature instead. Can this feature be disabled
| somehow, because I don't see why anybody would want it?

| > Yep,
| > that's right!
| > If you press any button after startup, the bootloading starts
immediatly.
| > You probably don't even have to wait for the memory check to be
finished.
| > Doei!

The boot delay /can/ be worked around. I wrote a program soon after getting my MegaSTE, that sits on the bootsector of a High Density floppy, permanently resident in the A drive, it sits and waits for 6 seconds before returning to the system having set the timer accordingly, giving an immediate hard disk boot. No fart arse risky re-booting like some utilities. There are also other alternatives available on the web, No-Roach is the official Atari effort.

I have supplied and used Quantum LPS and EPS drives up to 540mb with no

problems, also HP and Fujitsu.

It is best to test before you buy, always get the jumper details if
possible.

As I have previously stated here I have genuine Atari TOS ROMS for sale.

I have most of the Atari parts and spares in stock.

3.06 was not the only TOS ever for the TT. There was also 3.05 that came on
a 4 chip set (28 & 32 pins)

Don

Well, it can be... sort of... there is a patch to be applied to TOS 2.06
image- if you can burn a new set of EPROMs afterwards... the patch
reduces or completely disables disk spin-up wait.

Possibly... but I suspect that a Mac with MagicMac would make a better
STe than a real STe :)    ... can it be configured to boot straight
into Magic?

>I also just recently downloaded info on how to use a 16MHz 68000
>processor which seemed to be a very simple project to do.

If it is a design without cache, which just switches the CPU clock
to 16MHz whenever possible, then it is simple... and not very efficient.
Overall speed increase is about 10-25% ... and there is a possibility
that it would not work. Apparently it depends on the quality of the
particular chip set in your computer. I have tried such an accelerator
and, although it works, it is not reliable on my MegaST. On the other hand,
L.Amsdon has made an almost identical thing which, on his ST,  seems to work.
from what I have gathered on the subject, it seems that you can expect
problems if you happen to have RAM and/or ROM chips slower than 150ns (I have),
or if you have 74LS373 and 74LS244 chips (I have them too) instead of 74HCT***
or 74ALS*** or 74F*** or Motorola's 74LS***.

It is my opinion that it is a better aproach to overclock the complete
ST computer to 10MHz (or 12MHz), which surely gives a speed increase of 25%
(or 50% respectively) on everything, and is not so hard on chips, but with a
drawback of requiring a multisync monitor (or a more complicated circuit).

I wish it was just a duff connection. I have a few suspicions but the
MegaSte seems to be the most convoluted Atari ever built. More Gals than a
lesbian site;-). I had sort of thought it may be the floppy or related, you
know the old crap in crap out adage. So I changed the floppy, cable and wd
chip. No luck, but still leaning towards the DMA chip. Will try again
tomorrow, work is quiet.

Mark

Hey!

I got a dead Supra Drive 20mb hdd that I never could make work. But I got a doubt: When I connect it to the ACSI port of my 1040STfm, the floppy drive does not work.... anyone knows why?

If I buy another hard drive.... perhaps the floppy will work? Perhaps it'll work if the HDD driver is installed? I know many people has the same problem with similar machines....

I can only speak as I find, both the LPS and EPS worked fine and that is
what matters most.

Most musicians will trade a little speed for a quiet drive, other users may
not.

I've used an EPS for the last few years, wouldn't trade it for anything.

But each to his own.

Only of the Commodore has a 1581 (?) Floppy - the one that can read/write
CPM disks, which are in FM/MFM format like PC disks.

A 1541 can only read/write GCR, and so you can't even read/write single
sectors on a PC/Atari/Milan/Hades in that format.

>depending on the type of EEPROM you are using. Does the TT have these
>jumpers? Where are they what are their number (i.e. U102, J12 etc.)

Since the original TOS usually comes on EPROMs, you should not have to
change anything.

>I was thinking I might be able to use 4x27M1001 (128k*8bit) EEPROMS
>that are in STe's?

EEPROM? 27*1001 should be EPROM, not EEPROM. 27*1001 might work, there are two pinout versions, depending on manufacturer - most will fit in a TT if they are fast enough.

>lesbian site;-). I had sort of thought it may be the floppy or related, you
>know the old crap in crap out adage. So I changed the floppy, cable and wd
>chip. No luck, but still leaning towards the DMA chip. Will try again
>tomorrow, work is quiet.

I bought an STFM recently and noticed something odd. Both the Shifter and DMA were in a socket and they had a white dot painted on the tops. Shifter is usually socketed though. I then had another STFM, this had socketed WD floppy controller but had the shifter soldered in! I seem to remember seeing a friends STE with socketed Yamaha chip. They all seem to differ so much. Do you have an ASCI or SCSI adaptor to test your DMA port. Have you checked the DS signals from the Yamaha?

```

I've heard that switching those to faster ones is a good thing to do even you don't want to go any faster. I'm almost finnsihed on my last 16MHz design. Uses two 74**00 NANDs and 74**74, best to use F or HCT. Has a special pin called Fast Pheriphial which is pulled low to signal a device that can accept transfers at 16MHz. This could even come from a 13 input NAND gate and then you have up to 13 devices that could be made to communicate with CPU faster than the slow old bus. My first thoughts are ROM, IDE, FPU and even some sort of graphics card. It could even be used on cartridge port if the cartridge device can accept the speed.

>It is my opinion that it is a better aproach to overclock the complete
>ST computer to 10MHz (or 12MHz), which surely gives a speed increase of 25%
>(or 50% respectively) on everything, and is not so hard on chips, but with a
>drawback of requiring a multisync monitor (or a more complicated circuit).

Yes. I think the problem with it not working on my system was that my old Microvitec can't stand the high refresh rate. It doesn't like 48MHz which would be giving the monitor a refresh of 106.8Hz. At double the speed and double the refesh I get two pictures side by side, sounds like it isn't swithing over the relays for another sync band range or however these things work. I'm not sure if the RAM would like the increase in speed. From my observations the first thing to splutter at increased speed was my 256k*1 DRAMS rated for 125ns (IIRC). If I manage CPU at 16/32 and system clock at 64MHz then I hope to get 2*1.3 or 2.6 speed increase. That's excluding faster ROM access or those likes. Stick NVDI in and it should be comfortable at most tasks.

Hi Facundo,

>I got a dead Supra Drive 20mb hdd that I never could make work. But I
>got a doubt: When I connect it to the ACSI port of my 1040STfm, the
>floppy drive does not work.... anyone knows why?

OK, the hard disk port is controlled by the DMA chip so that transfers to RAM don't have to bother the CPU so much. This is also used to

send/retrieve data from floppy drives. Sounds like your harddisk is
messing up the DMA chip and causing it not to be able to communicate with
floppy correctly. I'd unplug it straight away.

Correct. Given all the hassle, I would not bother building such a circuit.

The best solution might ba a PAK3+FRAK combo. The second best is probably
something like this:

http://www.ccac.rwth-aachen.de/~michaels/images/MagnumST-36MHz.jpg

(picture with 28MHz oscillator, but it worked fine at 36MHz).

A 68000 with 36MHz, 0-waitstate DRAM easily beats a PAK-3 with a 36MHz

68030, so you need the fastram-card for the PAK-3 to get more speed than
this :-)

And no, I don't even have schematics for this hack anymore, and I don't know
where I put the CPLD equations.

cu
Michael

Do you really do not know there are floppy bootsectors you can install,
configured to check and wait for drive ready on any scsi address ? That's
whyI always keep one floppy in the drive, and damaged few of them during the
years, worked for a 520ST, MegaST, MegaSTE and TT030.

Some names: bootsie, waitini, HDwait, noroach, waitint....

I did forgot to mention something. The floppy still doesn't work when the HDD is turned off. So, If I just plug the ACSI cable, the floppy doesnt work.

I know them but a good operating system should not require these and
should not force me to have particular floppy disks in the drive when
booting.

Ok, I've found noroach and bootsie, together with mouse25, to get rid of
another Atari 'bug', the original Atari mouse ;-)

I totally agree with Uwe on the harddisk boot issue. Being able to work
around the problem is a good thing, but it shouldn't be necessary to do that
in the first place. I find it rather strange that Atari didn't even improve
this harddisk boot code for the TT TOS as I understand from what Mike is
saying.

But I still like my Atari :-)

Cheers,
Martijn

Hi group,

I'm looking for an external SCSI host adapter for my Atari Mega STE, to be able to make swift harddisk backups to my PC without too much troubles. I'd be interested in an adapter from for example ICD, like the Link, Link 2, Link 96 or Link 97. Adapters of other brands or DIY kits, working or not, wouldn't be a problem too.

Thanks,
Martijn

I've done this very thing, never seen problems, used ribbon cable (the multi coloured type). Took the socket off the ST board, fixed it to the tower case panel.

Soldered the ribbon cable to pins on the 13 pin socket, the other end runs into a small 14 way IDC connector. On the other side, a 14 way IDC socket is connected via ribbon cable to the ST PCB.

I use a mono monitor.

Hi Facundo,

>I did forgot to mention something. The floppy still doesn't work when
>the HDD is turned off. So, If I just plug the ACSI cable, the floppy
>doesnt work.

OK, first just unplug the cable in and check floppy. Then plug _just_ the
cable in, see what happens then. Now plug HDD in and turn on, what now?

Hi Hallvard,

>1) how much (approx) will such an accelerator cost to build? According
>to what I've read it might be hard to get the actual 68030 processor,
>but apart from that...

Rodolphe Czuba has some PGA 50MHz 68030 in stock IIRC. I was very
tempeted to get them as I thought it was cheap.

Screen the wires would give best results. I would say you may have a problem doing this for the 13 pin socket as I can only find this socket in PCB mouting format with small pins. It'll be more difficult to solder to like that, you may want to mount it on a small board or something.

If I remember correctly some earlier references you made to this, it is
a design with a CPU + fastRAM completely asynchronous to the rest of the
system, right? From what I can gather, MC68000 was -designed- to work
asynchronously so any hypothetical accelerator design might inded
concentrae upon that concept?

True, but default wait in TOS 2.06 is probably naturally tooooooo long for any decent
drive except possibly some very old ones.   Even with old no-boot-delay
TOS1.4 my DSAS-3540 IBM drive gets ready long before TOS finishes
interrogating the floppy at power-up.

Exactly the same. The floppy does not work. If I unplug it, the floppy
works... pretty weird isnt it?

Hi Hallvard

| > The best solution might ba a PAK3+FRAK combo.
|
| This is something I could be interested in looking into, but I'm trying
| to get some basic information about these things first.
| I've already visited WRS online (http://www.wrsonline.de) and tried to
| read what's there, but with a limited knowledge in German I haven't
| gotten very far.
|
| Anyway, I'm looking into several hardware solutions for expanding an
| STe, and acceleration could be one of them. I have some questions first:
|
| 1) how much (approx) will such an accelerator cost to build? According
| to what I've read it might be hard to get the actual 68030 processor,
| but apart from that...
|
| 2) Is it possible to switch off the accelerator? Hardware or software
| switching?
| If it can be switched off, will the STe function *completely* as a
| standard STe, or could I get problem with software that only runs on
| standard/plain ST/Mega/STe machines?

You can add an optional 68000/TOS 2.06 mode@8Mhz, in the case of the
MegaSTE, you must decide this in advance and obtain the neccessery GALs and
a DIL 68000, although ive never had to use it myself.

| I'm thinking mainly about Notator SL here and other MIDI applications
| which don't work with accelerators.

Dont know about this stuff, i'm a strict listener.

| 3) For the STe an adaptor board is needed (probably because the PAK68

| uses a DIL socket for use with ST/F/M/Mega machines while the STe has a
| PLCC styled 68000.

See below.

| WRSonline doesn't have any more of these, so would it be hard to make my
| own board from scratch?

You'd need the GALs obviously and you could design your own layout.

| In other words: is the adapter board just a mechanical adapter which
| allows the fitting of the DIL type socket of the PAK68 into the PLCC
| socket of the STe, or are there electronics involved?

It is in fact a buffer board, correcting some timing issues between the PAK and the host.

| 4) WRSonline sells the PCB, but at DM 99,- it's a bit steep in my

| Has WRSonline developed the PAK68 further perhaps, so the C't issued
| circuit boards are different?
| Does anyone know what the differences are, if any?

Some GAL's have been modified for various reasons, these deatails are ont the WRS site though, other timing issues have been addressed but i think the PAK board is the same as the origonal.

| 5) There's a memory expansion device called the FRAK2 which was
| suggested to me in a previous thread where I asked about memory
| expansion above 4 Mbytes.

FRAK 2 utilises a different type of memory card, giving the user a possible 128Meg of TT ram, wheras FRAK 1 is 16Meg maximum with 32Pin simms.

| I understand that it relies on the PAK68, but does this also mean that
| the accelerator has to be switched on to use the extra memory?

Not as such, it relies on TOS 3.06 and you only get this in 030 mode, but you get true 32Bit wide memory as opposed to 2 * 16.

| Again, getting back to Notator and other MIDI software... I could use
| more memory, especially when running "SoftLink" (a multi-tasking sort of
| program-switcher system, mainly for MIDI software, by C-Lab/Emagic).

| The FRAK2 it seems gives "TT RAM" in addition to the 4 Mbytes of the STe
| itself and I'm guessing that SoftLink will refuse to work with it, but I
| could be wrong.

If it works on a TT it will work with a PAK, i myself have all programs set to use TT ram.

| If SoftLink assigns its programs to specific areas of ST-RAM, could the
| FRAK2 be used for everything else not related to SoftLink such as

| ACCessories, AUTO programs and whatever else is loaded into memory
| before the MIDI applications?
| Is it possible to "re-route" the memory so that this sort of thing would
| work?

Set the TT ram flags appropriately and it will run/malloc in TT ram, as
simple as that.

| 6) There's a card called "Panther" which allows for standard ISA PC type
| cards to be used (i.e. Ethernet and graphic cards to mention a couple,
| according to the information at the WRSonline site).
| How expensive would it be to add something like this to an STe for full
| Ethernet and hires colour graphics?

My mate derryck hard wired a graphics card into his STfm, the details for
that were PD i beleive.

| Does it need the PAK3 to function? My guess is that in order to work
| properly it will rely on such an accelerator...?

Nope, it will work in 00 mode but dog slow.

| As I said, at this point I'm open to all and any suggestions for the
| rack-mounted STe I'm currently working on.
| I have to plan ahead as it's going to be hard to add things like this
| later (i.e. because of the additional space, board-placements, holes for
| placements of switches/sockets on the front/rear panel etc.)

You'll need a beefy PSU and plenty of cooling.

--

Regards from STEve & his nice warm cosy PAK'd MegaSTE.

Hi Facundo,

>> OK, first just unplug the cable in and check floppy. Then plug _just_
the >> cable in, see what happens then. Now plug HDD in and turn on, what
now?
>
>Exactly the same. The floppy does not work. If I unplug it, the floppy
>works... pretty weird isnt it?

Sounds like a broken DMA lead then if it doesn't even work with just the
lead plugged in!!

Sorry, I thought these were going to be ones with small amount of memory.
Does anyone know where I can get schematics/plans for one??
Perhaps it should be something I should try, could get complex though. I
imagine it's just a case of intercepting the strobe and busy lines and
take the computers output into some large SRAM then send it back out.

74HC133, same chip as used in one version of an Atari IDE adaptor IIRC.
Probably quite useful in some circumstances (like mine).

>
>For just the R/G/B wires with separate screening then?
>The other pins aren't that sensitive to outside "noise" and things like
>that, are they?

Yeah, RGB are most sensitive and I would screen the mono pin too. You may want to screen the syncs, it's done on monitors with BNC conenctors that are usually used on higher end monitors. You have a seperate BNC for RGB and two syncs. Use 50ohm coax to go from the modulator output to the back panal. I would make a little board with whatever is required. So you could have 13pin socket, 15 pin VGA style socket, SCART and a small switch to pull mono detect to ground.

:> : dual-in-line package, nicely socketed for convenient extraction...
:> : May be conveient for someone toying with ideas of upgrade hacking.
:>
:> I've recycled a whole lot of 10MHz DIP 68000s from an aluminium can
:> recycling machine made by the Finnish company TOMRA.

: Actually Tomra is a Norwegian company!

I thought it was a Swedish company until I saw the copyrights on the PCBs.
For the sake of your national pride, I'll have another look at those
smelly PCBs before I throw them away, though. =)

: But getting a bit back to the subject again (despite a rather late
: followup from me)... considering that 680x0 processors can probably be
: found pretty easily (and for very little money!) by getting hold of old
: Macs (in these days of PowerPC based Macs), would it be a major project
```

: to adapt one of these (68030 or 68040 most likely) in an STe?

Apart from the '040 machines, I think most 32-bit Macs have
surface-mounted PLCC processors. I think so, at least.

: I've been looking a bit into the PAK68 accelerator which seems like a
: *huge* project, but as far as I can see it won't end up that expensive
: (if I haven't mis-read the parts list, only having seen a partial one or
: something) as long as a CPU chip can be found.

Shouldn't be difficult, Macs or not. Electronics shops or perhaps Amiga
dealers should be able to supply them.

: I also just recently downloaded info on how to use a 16MHz 68000
: processor which seemed to be a very simple project to do.

But is there much of a performance gain? A cache makes for some speed-up,
but will it make much of a difference in reality?

Hi

Just like to report I have a succesful 8/16Mhz hack that I have been discussing with Djordje recently over email. I uses the Shifters 16Mhz, so no external oscillator is needed. It uses two 74F00 NANDs and a 74HC74 flip flop. I only have HC, it should be better to use a slighty slower flip flop than an 'F' grade part. I will release the schematics for it and a small doc on my website, just seeing how many people are interessted. It also includes a FSPH pin, this is used to make the CPU go fast speed if a pheriphial can support it, ie, faster ROMs.

Speed increase is about 125%, but I'v just used the FSPH pin connected to my TOS ROM signal and got an extra helping of speed. I _haven't_ replaced my old TOS 1.04 ROMs, these are stock Atari parts. I have installed faster bus driver chips ('F' grade). This hack should work for people with the standard speed rated CPU as they are only at 16Mhz for a percentage of time. I have to note that this has been untested on a blitter equiped ST, this may cause problems with bus mastering according to Djordje. It would be nice if someone could test that.

Anyway, these are the results from GemBench, I ran them twice to make sure the machine was stable, seemed pretty OK to me. Graphics increase is good due to all the VDI routines being in the ROM!!

```

Oh, that one! Strange, one of the chip catalogs that I have has
discontinued stamped over data for this chip- and another catalogue
doesn't list it at all. So I never bothered to look for this chip.
So it is still around, in fact?   It would be very handy sometimes.

Hmm, looking at Farnell they don't have in in HC or F but do have HCT, two
manufactuers avaialbe to order and none have a "limited stock" mark.  It's
also available in LS.  Rapid Electronics also has just the LS version and
Maplin have stopped selling it.  I'd better get a few before they stop
making them!!  I've never seen one on boards before.

You could use a solid state drive, ie, one with battery backed RAM. These are coming down in price. I've seen ones for IDE a lot but I see no reason why you can not get them for SCSI. Just look into a large PC chainstore or website. DABs and Simply in the UK should have these kinda things. No noise at all. And because Ataris are so great, out apps will fit on them fine!! You'd have to look into it, but the IDE drives are very fast and comply to the IDE standards. I think they use same cards as camera flash cards, over on comp.sys.atari.st someone managed to connect a SCSI flash card reder to his Falcon and read and write fine

A new lead, but these are diffuclt to get hold of.  Anyone know where to
get the 19 pin d type leads?

Right. This is probably caused by the harddisk continuously asserting the
INT line on the ACSI port, which disturbes interrupts from the FDC, too.

Either fix the harddisk or throw it out.

Neither have I (except for a battery-backed one with 128K memory, which
is only produced for internal use).

>According to listings of German computer magazine "C't", one issue shows
>how to add a VME bus to an ordinary ST. Could be useful for something

And then? If you have a normal ST, it would be much easier to add a MagnumST
or similar card - plugs directly on or below the CPU (where you would attach
the VME bus anyway), and has a much lower load on the bus signals.

The should be quite cheap now as recycled items - definitely below 20DM (you can get a 040 in that price range!).

>2) Is it possible to switch off the accelerator? Hardware or software
>switching?

It was possible with an add-on circuit, but in that case, you probably can't use the fastram card since that is plugged into the 68000 socket on the PAK.

>If it can be switched off, will the STe function *completely* as a

>which don't work with accelerators.

Better keep an unmodified machine for these.

>3) For the STe an adaptor board is needed (probably because the PAK68

>PLCC styled 68000.
>WRSonline doesn't have any more of these, so would it be hard to make my
>own board from scratch?

All the PLCC adapters are quite a hassle: too much contact problems. The only really reliable solution is to completely de-solder the PLCC socket

from the STE board, and then solder single pins in its place (like the ones
used in normal IC sockets), and then plug an adapter board into that socket.

>In other words: is the adapter board just a mechanical adapter which
>allows the fitting of the DIL type socket of the PAK68 into the PLCC

It is just a passive adapter.

>4) WRSonline sells the PCB, but at DM 99,- it's a bit steep in my

>
>Has WRSonline developed the PAK68 further perhaps, so the C't issued
>circuit boards are different?
>Does anyone know what the differences are, if any?

the PCBs should be the same. Anyway, it is a 4-layer board, so 100DM is not
so bad a price considering the quantities that were produced - I think I
paid more for my board back when I built my PAK.

>5) There's a memory expansion device called the FRAK2 which was

Yes - the memory is outside the address range of the 68000 CPU, above 16MB.

>6) There's a card called "Panther" which allows for standard ISA PC type
>cards to be used (i.e. Ethernet and graphic cards to mention a couple,

>Does it need the PAK3 to function? My guess is that in order to work
>properly it will rely on such an accelerator...?

No. It does work on a stock ST, although I have also seen it used in
conjunction with a PAK - this gives quite a nice stack of boards on top of
the CPU socket :-)

No. The CPU clock is switched to the original 8MHz clock when accessing
ST-RAM and peripherals, however, the 36MHz clock which is used when the CPU
is not accessing the ST board is (obviously) asynchronous to the board
clock.

Yup, these NEC's are really BEAUTIFUL, aren't they? I feel quite inspired after looking at the careful engineering involved. I've had a 3FGe (junked because the blue cathode blew) and now have a 4E (not even listed by NEC - heaven knows it's pedigree).

Using the STinG tcp/ip stack you can connect them via MIDI cables or a null modem cable. STinG is NAT capable so you can for example dial in to your isp on one Atari and still have Internet access on both of them via MIDI. This will give you true multitasking in two threads and runs on standard TOS :-)

Check out http://www.ettnet.se/~dlanor/ for STinG.

There might be some minor problems but by using BNET you can open both Atari disk drive windows on both computers to transfer files.

Check out http://users.otenet.gr/~papval/ for details.

There is also a Samba client there but you will need Magic OS to be able to run it with the MagicNET stack instead of STinG.

The STm, Stfm, STE and later models do have composite output.

Hello,

I used a Video Key and a video converter to hook my STe up to my 17
inch SVGA monitor. Looked pretty darn good actually.

Hi,

I just bought a second hand Mitsumi FX001 CDrom drive, with an Overscan Rom port cartridge. This CD rom player is connected to the Atari ST through the ROM/Cartridge port. Unfortunately I have no driver software for it. The interface is manifactured by Overscan (Atari oriented company from Berlin) .

Is there anyone who has the CDROM driver for me?

Thanks,

Marco

I asked a question in another group about upgrading a 520 ST and this is what the reply was:

> The easiest RAM upgrade is probably to deactivate all the on-board memory
> (ie. cu the RAS/CAS lines and tie them high on the DRAMs), take a 4MB
> PS/2-SIMM and connect that to the ST board (connect D0-D16, D1-D17 etc. on
> the SIMM, and use it as two banks of 16-bit memory).

Is there a document out there that explains this procedure, or anyone want to take a stab at it. I have limited experience with this stuff, but I can solder and I have assembled PC's from scratch (please, no laughter)

Would that be an EDO SIMM?, or a regular SIMM and what would I 'seat' the
memory IC into. I cannot seem to find any SIP's either
But I would think a 4meg simm would be easy to come by

Thanks

HipCrime offers a new service: Custom massive spamming, FREE.

Just post a URL to Free.HipCrime, and a "joe job" spam will be
conducted via both Usenet and Email. Your article will appear

in _every_ newsgroup (even moderated ones), and it is protected from the filters and cancelbots by the latest in hash busting & cancel preempting technology. Plus, your message will be sent to many millions of emails (direct from closed, non-blacklisted mail servers).

This will give you the best of both worlds: gigantic growth in your site's traffic, combined with "plausible deniability" with regards to any complaints.

Your site will become "internet famous" overnight, and a critical mass of visitors will make it a "net hot spot" for years to come.

Got doubts? Just check with some of our happy customers, whose traffic rates have recently shot through the roof, for example:

http://www.osearth.com
http://www.careermd.com
http://www.dolphinwave.org
http://www.spamhunter.co.uk
http://howardk.moonfall.com/
http://www.trance-formation.com
http://www.trance-formation.org
http://hometown.aol.com/frederi108
http://www.optional-identity.org.uk/
http://www.coollist.com/group.cgi?l=nntplist
http://www.hotboards.com/plus/plus.mirage?who=zodiac_16

HipCrime's ActiveAgent harvests email addresses by crawling the World Wide Web (HTTP), scanning Usenet Newsgroups (NNTP), or by loading compressed mega mailing lists (ZIP) like these:

http://64.227.13.120/here.zip
http://cyberspacereality.net/flamers/masterantis.zip
http://cyberspacereality.net/flamers/masterantis2.zip

HipCrime's ActiveAgent, the interNet's premier Publicity Engine, is the integrated multi-protocol spamming solution, guaranteeing anonymized saturation of both Usenet News (NNTP) and Email (SMTP).

Get your copy today, or get HipJoe'd ... it pays!

>memory IC into. I cannot seem to find any SIP's either

EDO or FPM will both work. You can use a socket, but the easiest way is to solder wires directly to the contacts on the SIMM.

G'day, just email me and I will send the docs. No EDO allowed unfortunatly.
Just fast page, only stipulation is it must be more than 120ns. There are no
specific docs I know of but should be able to find something close enough.
You need to have a basic knowledge of ram addressing and banking for it too
work, tho.

Mark

If you are talking about an origional 520 ST, i.e external PSU, floppy drive
and TOS 1.00, the easiest upgrade is to buy an STE.

If an STF or FM the Marpet kit (in stock) is usually the easiest.

Horses for courses.

Hi,

I'm looking for a Atari 1040 STFM english language disk. The contents in zipped format, would be great. Can anyone help me?

Thanks & Regards, Marcus.

Hi group,

Has anyone ever seen an IDE adapter that is usable on a Mega STE? There are adapters available for the ST(FM), STE and Mega ST, but I haven't seen a single one for the Mega STE.

Cheers,
Martijn

I think you will find that the one for the standard STE will work. Theres no reason why it shouldnt as they are identical apart from the 16mhz clock and a couple of minor things.

This is the disk that originally shipped with the ST. Contains the crappy
ST Basic, the Control Panel and the VT52 emulator.
The one who asked for it, http://stappz.atari.org/ has one IIRC.

Mark Bedingfield <atari@tpg.com.au> writes:

: G'day, just email me and I will send the docs. No EDO allowed unfortunatly.
: Just fast page, only stipulation is it must be more than 120ns. There are no
: specific docs I know of but should be able to find something close enough.
: You need to have a basic knowledge of ram addressing and banking for it too
: work, tho.

: Mark

Are you sure about that? I had some reason to investigate EDO, and what I think I found was that it had extra circuitry, so that if the computer it was in wanted to start the next memory access before the last one had finished, it could. That would result in a speed increase of 10-15%.

And, if it was not in a computer with this feature, it would act exactly like FPM memory.

My reason was related to the vague idea I had of making my own Maxon memory board for a TT. It may be that all that is needed is two 50-cent sockets, and one dollar socket, and some buffer chips. At worst, add a GAL to decode a memory address. That gadget used EDO SIMMS, and worked. What else I would need is a cash windfall, first.

Have I overlooked something?

Anxiously awaiting your reply,

Jim

Hi

I have some word documents on Ist mail (I have the programme) which I need
converted into PC/MAC format. Any help or pointers would be most
appreciated.

Antony.

I should have kept my old 1040ST it nver crashed once!

Hey guys,

Is there any way IN EXISTENCE to upgrade a Mega STe over the 4 meg limit.
I know these boxes are able to handle up to 16 megs of ST ram is the MMU is
right. Is there anything out there at all, and if there isn't how hard
would it be to make something? Anyone know any specifics on this? i would
really like to use my mega STe again.

Thanks
Mark

Not a hudred percent sure. I know that on WCs pre EDO machines had a
distinct tendancy to crap them selves alot with EDO. i.e. 486 and the likes,
I had heard similar stories of Falcons and STs. If you solder in a 72 pin
socket, it would be easy enough to find out tho ;-)

I think you will have to treat it like uprading an STFM to 8mb or 14mb or
whatever. You can only physically address upto 16mb, and you have 2mb taken
off that because thats where the hardware registers and BIOS are etc.
Have a look at http://atarihacks.cjb.net/ there may be something on there.
If you find out let me know, I run a 4m MSTE next to my 14mb Falcon, I
probably wouldnt touch it cos I use the Falc for work and the MSTE for
games, but i'd be interested.

Only if the do bank interleaving - that causes problems with EDO memory.

However, I am quite sure that the Atari MMU does not interleave accesses to
different memory banks.

I am trying to conect an Iomega Zip (SCSI) drive to my Atari STe
computer. I need information as to how to connect the Iomega-supplied
cable to an ICD Link 2 which will be connected to one of two ports on
my hard drive. The other port (identical) is connected by means of an
old standard ICD Link and then to the computer by an extension cable.
Also, do I have to buy a separate driver, or will ICD software enable
me to use the Zip drive when properly connected?

The intent is to back up my hard drive to zip disks which hopefully
will then transfer to my PC.

I'm NOT crazy, am I?

Consider me a novice and you'll be mostly correct. Thanks to anybody
who can and will help.

One too many Links. Possibly wrong kind, and wrong driver program for what you have in mind. Only one Link is needed.

You need a Link between the STe and the external harddrive, which should be set to provide bus power, and whatever cable fits between the other harddrive port and the ZIP drive. The cable that comes in the box is not the right one for that. The second Link would be trying to convert SCSI to SCSI, with uncertain results.

The ZIP drive termination switch should be set to ON.

You do have a SCSI ZIP drive, don't you? The parallel port kind will not work, and those with both SCSI and parallel ports have produced complaints from unsatisfied users.

ICD software will do the first part, backing up your hard drive, just fine.

But if you want to format a disk that can be read by a ZIP on a Windows machine, you will need HDDriver, by Uwe Semet. ICD programs will do almost everything but this.

And, you might need a Link 96 or 97 to make it all work. I personally have had no luck running HHDriver over an ICD link, but maybe I quit trying too soon.

HDDriver is a maintained driver, and the newer Links do certain things the ICD Links do not do. You will not be sorry to have both of these things.

HDDRIVER with an ICD link definitely works, I have an ICD link myself
for testing purposes.

Ask Mario Beckroft if his interface works with Mega STE's.

Mario's IDE interface as well as the TUS IDEal interface will work on a Mega STE with some modifications. I still have some questions about if this is the right way to go or to go the SCSI-way, etc. I'll ask these questions here later this week.

Martijn

Yo. I have gradually come to the opinion that what goes wrong with SLM printers is that the wiper blade ceases to wipe properly, due to age and oxygen, and not because the drum is not working.

So, when the old-as-dirt but new-in-box drum assembly started putting toner in the background, I took out the wiper blade, rubbed its flat edge on the surface of a flat file, removing very little of what ever kind of rubbery plastic that is. When I put it back in, the printer worked a lot better. That was satisfactorily cheap, too.

So far, so good.

You definitely need the Link2 because it supports parity devices like the Zip.
You will also need a custom power cable from the Atari to the Zip.
I'll post the schematics as I'll be building one soon.

Good Luck!

Spot on, altho if like me you have a MegaSTE without an HD interface and
Bay, it makes good sence as a 2.5 inch IDE will fit in one fine....

Mark

Hi,

I have a Mega STE with a broken keyboard.
Is there anybody who knows where I can
find a Keyboard, or a PC-keyboard emulater
(if there is any) as near Sweden as possible.

Thanks in advance for answers.

Regards,
        Saeid.

The only place I know where you can get a brand-new keyboard is best
electronics. They are really expensive though.

Hello.

KeychangeMusic in the UK sell unused Mega STE keyboards.

Now you know two places.......

Barrie at Keychange.   www.keychange.co.uk

Hi rezx0x@yahoo.com

| You definitely need the Link2 because it supports parity devices like the
Zip.
| You will also need a custom power cable from the Atari to the Zip.
| I'll post the schematics as I'll be building one soon.

If this is for trmpwr then the same can be achieved internal to the zip with a diode to the +5v line, no messy cables this way.

Didn't the Link (not Link2) also support parity?

Hi group,

where can I get those IDE adapters for the STE / ST(FM) ???
Are there some DIY ?

Thanks, Mike

I dont see any messages in my browser (Netscape 4.72)
It says there are 12 though.
I think my isp is messing things up.

Maybe if I post myself it makes a difference.

As a general question, is there any one piece of ST hardware that typically 'goes south' before others?

Monochrome Monitor
Colour Monitor
Mice
Keyboards
CPU or other I/C's
Floppies?

Just wondering if there are any comonents I should be stocking up on. And conversly, which components are the best made

Thanks

I'd suggest you to take a look at the SilentDrive from QuietPC. It's an
acoustic enclosure that fits around 1" high, 3.5" wide drives and reduces
hard drive noise by over 90%, as they claim. Here's a link to the website:
http://www.quietpc.com/silentdrive.html

Cheers,
Martijn

>So, if I understand you correctly you've (a) extended the actual 13-pin DIN connector, and (b) you've taken the connections of the extended connector to make a VGA compatible mono output as well?

No, I've just extended the socket from the board to the back of the large PC case my ST now lives in. I did not do any extra wires for a standard VGA socket, but that's a really good idea, as I could just wire in parallel (might need a buffer if I wanted to use 2 monitors at once) onto a VGA socket & mount it on one of those PC I/O panels.

>How's the quality of the picture? Problems with "ghost image", lines or blurry display as mentioned by others here?

Picture quality is fine. There are sometimes problems with the ST's video output, I remember seeing modifications in one of those old "CHIPS" files. Something about a capacitor to reduce lines on the screen.

>
>I haven't studied the available VGA adapter circuits that close yet, but it looks like I could add a mono/colour switch at the back of the computer so that a VGA monitor could be used in all 3 modes (provided the monitor connected can handle all of the used frequencies). From memory I think this is just a matter of wiring up the "mono detect" pin via a switch which goes to ground (?) or whatever signal it needs.

This sounds right, but monitors which work at ST frequencies are hard to find now.

>
>And small potmeters for the R/G/B lines would most likely give me the ability to adjust the mono screen (in case I want a monochrome green screen like in the good old days, orange, blue or whatever....or even just black/white ;-)

This sounds like fun, why not have a bank of DIP switches & resistors.

>I could design all of this on one board and just have that short ribbon
>cable you've used between the location of the 13-pin DIN connector of
>the ST main board and this new board.
>
>How about the RF output? Is it more sensitive to moving around?

The RF output is also moved to the back panel. It seems to be fine, but do watch out for ground loops, I did not connect the co-ax screen to the back panel, as it is already connected to ground at the modulator case. This gives a better picture.

I also installed extra RCA connectors, for sound out, & RGB, but I have not used these yet.

I think you need TOS2.06 in order to boot from hard disk.

Otherwise you have to boot to GEM, load the drives and access the hard disk from there.

Alex

Hmm, now that's a bummer. I must say that I haven't used it myself, but I was planning on doing so soon. But after reading about your experience, I'll probably go look for another solution. Acoustic isolation is still high on my solution list though.

Cheers,
Martijn

I have a SCSI PCMCIA device in my Hades060 setup, I use it to read the pictures directly from the camera's SmartMedia card with a small adapter.
I also have one on my TT030 and I actually use it to move files back and forth via a 128mb SmartMedia card. My zip drive crapped and I got tired of moving small bits of info with just a floppy disk. I can read/write and format the cards just like a harddrive.
